Another thought on the drive levels Ed:

In SETUP for V4 there is a DRIVE LEVEL setting. Leaving all else the same, you might try reducing that to perhaps 50 or 70% to see if that makes a dif in your ALC issue. That would tell you it is all just overdriving the rig. I looked at the RB+ manual and it just looks like a stright interface so levels can be set at the PC (WIN AUDIO Output settings, at the Interface and at the Rig. Not sure yet if the V4 Setup drive level setting changes the windows levels or not but I suspect it may not so try that.

From: captcurt@flash.net
Topic: 1459 Message: 1459

Hello to all:

Several times now, during unsuccessful attempts, I will do a ARQ Call to a Callsign and get a CONNECTED TO message and the system starts to cycle the (I think) IDL . The ARQ State is cycling from IRSWaitLeader to TransmitACK (think that is right msg) which is orange.

So I type in some text and hit CTRL CR and the text goes to the Session text box but the OB Que never changes from 0 to show the text was queued.

Is this because the text wont go into the queue until I am ISS? I first thought it would queue up and wait for the ISS or does it just stay in the buffer?

It seems when the system gets into this cycling loop it never exchanges from IRS to ISS and I never am receiving anything from the other station either. Constellation was score 58-60 S/N 0 or -1

Does this just sound like a quality of signal /strength issue in the exchange of ACK etc?

The basic decoding seems to be pretty good..even printing CQ Requests that are barely heard. But synching up and exchanging is much more sensitive.

Is there some typical lower threshold of S/N or Constellation score that has been seen so far?

I basically agree with your observations as my experience is similar. The frustrating part I have is that the connection seems to go idle and I never become an ISS and then it times out. I am beginning to believe that signal level, noise and QSB impact the timing sequence of the protocol steps and the expected transition and exchange is not compatible with the conditions. If I switch to FEC connections every time are very good and the exchange of the conversation flows relatively smooth. When QSB hits and parts of words are missed, just like in CW you can fill in the blanks.

I would like to test V4 with a rock solid RF connection. With all respect to Rick I'd bet it would be perfect.

Hi Ed:

I'm stuck..perhaps Rick can tell what is going on. I noticed Score 20
S/N 10.

I am sending him my log and you should send yours as well. Both of them
for this date and point to the period from 2300-2317Z. Rick can match
them up and see whats up.

Still think it is a signal quality problem of some sort or TR latency.
mine is 100mS +/-

1463. Re: [V4Protocol] Operation Questions/ Observations today.

Yahoo group: V4Protocol
Date: 2011-07-31 23:29:04 UTC
From: Curt Nixon
Topic: 1459 Message: 1463

Hi Ted:

Yes..I DID have two perfect QSO's today..both were pretty solid signal wise. Rick has my log so he can see what the S/N conditions were but audibly good.

I have read all the docs and papers and he does say that it is designed for NVIS-type of comm. That tells me it needs a good stable signal. He also says that to get ARQ to work, QRN, signal strength, etc need to be good at BOTH ends.

BUT..also mentioned is the target of a robust, weak signal keyboard mode. robust I expect refers to the error correcting. The FEC mode without all the ARQ synch overhead seems to be very good as I would expect.

Hey..this is what Beta testing is for. I think it is very cool. I appreciate what Rick and others are doing and know it is no simple task.

The thing that we can all do is to give the best, most objective, factual reports back to Rick and logs that show what he needs to see.

This is consistent with what I observed this weekend also. I spent some time looking at today's log and it appears that the decoding of session control messages is failing even in good signal condx which prevents the IRS>ISS switching. Several sessions I attempted today ended with 'ARQ timeout'. I just sent an email to Rick with logs attached.

THe interesting thing...and I think I cannot differentiate a root cause without a better understanding of the log data...is that successful QSO'sm occur with less S/N while the ones that do as you mention and never switch IRS ISS, Any issues with the quality , latency, etc of either end of the link will dump it out regardless of signal strength. I'm sure Rick can tell tho.

A lot learned (at least by this op) this weekend.

If you turn down the transmit power to near 0 does it still crash? If not you have RF feedback into the computer. I don't think there are any other problem like this reported and I am certain it has been run on Win 7 both 32 and 64 bit versions.

Ted, it would be nice to know what radio, you and others are running.

It seems all Flex SDR Radios , I know of, are never able to complete the task of receiving and transmitting the V4 system using ARQ. FEC seems to work fine.

Would like to hear from Flex users on their problems.

So I type in some text and hit CTRL CR and the text goes to the Session text box but the OB Que never changes from 0 to show the text was queued.

Is this because the text wont go into the queue until I am ISS? I first thought it would queue up and wait for the ISS or does it just stay in the buffer?

It seems when the system gets into this cycling loop it never exchanges from IRS to ISS and I never am receiving anything from the other station either. Constellation was score 58-60 S/N 0 or -1

Does this just sound like a quality of signal /strength issue in the exchange of ACK etc?

The basic decoding seems to be pretty good..even printing CQ Requests that are barely heard. But synching up and exchanging is much more sensitive.

Is there some typical lower threshold of S/N or Constellation score that has been seen so far?

From: Paul Whitaker
Topic: 1438 Message: 1470

Hi all,
I will be on 40 mtr at 13:30 Z - if anyone wants to try for a contact -
7036.5 USB.
I will be using V4Char Version 0.4.3.0 - although having a lot of trouble
with it.
I am also able to try Winmor ARQ keyboard mode if anyone is using it ?

Hi Owen:

I'm using a TR7 for all my digi modes and CW most of the time. My tested T>R latency runs about 90-110mS. Suspect others using much newer equip. I do have a Tony Parks SDR IF panadapter running on my r4 tho :)

Are the Flex rigs able to get below the 250mS T-R Latency threshold? That could be the root of the problem.

Hi Owen
I have a Flex 5000 A, Win XP, PSDR 2.1.5, V4 Vers. 4.3.0
Average latency below 100, max. latency below 200
tried on 14073 ARQ mode but no success, Heard a station but no connect.
Not sure how to differenciate between ARQ and FEC. Does V4 automatically switch the mode depending on partner station? How can I find out which mode to use?
Is this a proplem? Waterfall starts blue, but after the first ARQ CQ-call changes to black and remains black. Gets blue again when I close and restart V4 until the first call is made. I think it changes to black when the CW-ID is sent. CW - ID works now correct with new version 4.3.0.

Hi Ron:

I agree..this is the K3UK (Andy Obrien) sked page that I mentioned earlier. The only caveat I think, is that while it is great for seeing who is on, where, setting up tests, immediate test feedback, retries, and ops help, etc,..we need to remember not everyone is there and any critical feedback should be entered here.

1477. V4 QSO's

Yahoo group: V4Protocol
Date: 2011-08-03 07:59:43 UTC
From: ei5ds
Topic: 1477 Message: 1477

A note to say I had my first local and then DX QSO on V4 last night.
First QSO was with local station and neighbour Gerry/EI9FV on 14073.
Using low power we figgered out how the system worked on both FEC and ARQ modes. Noted the data rate exchange slow compared to the Amtor/Pactor systems we have used over the years.
]
After the test copied David/K3RQ. A successful QSO established with David on ARQ and then pleasant chat over about 15 minutes.

The setup is a TS590 using it's built in USB sound interface. The CAT interface (also on USB) used for PTT. The antenna is a 3 ele TGM mini beam.

Do hope this will encourage more stations to try the mode.

Ned (EI5DS),

I certainly enjoyed "connecting" with you last night via "V4 CHAT." I was truly pleased with how well the "ARQ Mode" worked between our stations even though the signals were rather week at times. I look forward to further testing of the V4 CHAT app with other digital mode-based stations worldwide in the coming months.

Cheers for now and I look forward to connecting with you again via "V4 CHAT" in the near future.

George,
I think we connected twice last night on 14073, I believe you copied me OK but then we failed to change states instead timing out. The second connection eventualy did change state and I received about 2 frames from you before timeout occurred. I guess the signal conditions were not quite up to it. I later heard you working an EI station but I could not hear them. Wrong band for that distance. Now there are more Europeans around we ought to try 40 metres a bit more.

Bob (G3WKW):

Yes, we did briefly connect last night via V4 Chat's "ARQ Mode." I think the initial problems I was having switching to the "Information Sending Station (ISS)" state was due to a personal "cockpit error." I was not clear on how to switch from the "Information Receiving Station (ISS)" to IRS. The "Ctrl & Enter" command suggestion you sent was very helpful and allowed me to unload my "Send State Buffer." Unfortunately, it seemed as if we lost propagation between our stations just as I was learning to properly command the V4 Chat's ARQ Mode. I guess this was just another occurrence of our Family Law (.i.e., Murphy's Law)!" Hi.

Bob, it was nice to meet you last night. I am now heading to lunch but will return to the "shack" briefly @1700L this afternoon (8/3) for about 30 minutes. If you are around 14073 KHz and we have propagation and the frequency is not in use, look for my V4 Chat ARQ-based CQ. I'll be delighted to QSO with you again providing that the frequency is clear/not being used and the "prop-path" between our stations is good. Cheers for now and have a great day.

I did wonder if it was just finger trouble! The Control+Enter isn't intuitive, you just have to Read The Fine Manual. We all expect to be able to use it first and read the detail later. It was only 2 days ago that I found the "End" button for the first time. I had read the manual from cover to cover that day so new it existed but had never seen it (or had a QSO successful enough to need it) They usually ended themselves as ours did.

GM Sir:

As you have no doubt seen in the help files and the state diagrams, the operator cannot actually change the state from IRS to ISS. THe only thing you can do is to move the typed text from the input window to the rich-text action window by using CTRL +CR(ENTER). Once that is done, it is then up to the ISS station to complete sending its Queue and when that happens, your waiting QUEUE will signal the ISS for a transfer. Without solid ACK/NAK and Synch of frames, etc, the transfer will not take place. From what I have seen so far, it all works like a charm as long as the link quality is high enough.

While the documentation indicates that FEC mode is less robust than ARQ, it is referring, I think to the ability to transfer a file w/o errors. If you can copy FEC frames, the brain is great at filling in blanks.

In order for ARQ to work, the link must stay solid over a greater period of time to ensure the the transfer and ACK of all the frames in the Queue , transfers, etc before it times out. QSB, QRN, QRM, etc APPEAR to disrupt ARQ more than FEC but it is the same. Its just that ARQ is ALL PERFECT exchanges or nothing (TIMEOUT)

Cheers

Topic: 1477 Message: 1486

Yes, you can't make it change IRS>ISS but you can certainly stop it by not having any data to send. Rick has said several times that it is called V4 Chat for a reason! You need to have something in the buffer ready for when the other guy runs out of things to say. No need to wait to become ISS before you start typing a response. I don't believe your outgoing buffer size is updated until you become the ISS. I guess that is because the buffer size is shown on the TNC panel and perhaps the text is held in the Chat program until you become ISS.

We had been connected for several minutes with a lot of IDLE being sent. I had sent an extra BTU and KK to keep the link from timing out then I sent "CTRL+ENTER" and George responded. But then I think propagation probably got the better of us. Now I know it was George's first ARQ QSO I feel better about the program's reliability.

Hi Bob:

Yes..that is what I observed regarding the OB Queue..it seems it doesn't update the OB Queue until you become the ISS even though there may be test there in Chat waiting to go.

I also had the CTRL +CR problem for a while when I started..its right there in the doc's but it isn't intuitive for a old fart like me!

Cheers and keep having fun. Perhaps condx will improve soon and we can do some transatlantic chat.

Topic: 1477 Message: 1488

Curt (KU8L):

Thanks for your attached feedback explaining how the ISS and ISR switch-over/handshaking" function is executed in the V4 Chat ARQ Mode. I am hoping to make a few additional contacts this evening using V4 Chat's ARQ Mode to ensure that I've properly learned how to use both the V4 Chat FEC and ARQ Modes. Look for me on 14073 KHz around 2230z later this evening (8/3).

Cheers for now and thanks for the feedback. I'm sure your corrective technical V4 Chat User-based comments are appreciated by the entire worldwide community of Hams interested in learning more about the present and emerging digital communication modes.

73,
George Murphy, K3RQ

Hi Pat, I also copied EI5DS but was not able to connect. I did switch to FEC mode and he was able to copy my transmission, he sent me an email confirming this. So may I suggest if conditions don't warrant an ARQ connect switch to FEC and try to send some text to the other station.

Frequency 14.073 MHz.
My station: Kenwood TS2000 running abt 50 watts to 135 foot long OCF dipole oriented in the North-South direction. Computer Toshiba laptop with 4 GB memory and duo processor. O/S Vista 64 bit. Interface SignaLink USB outboard soundcard. Lots of split-core ferrites on all leads (the only place there is no ferrite is in my nose hi hi)

Too many things happening at the same time so I used "canned" messages a lot and may have inserted text before Ron ended his transmissions.

Connected to KK7Z at 03:24:14Z and disconnected at approx 03:46Z.

Ron's typing was clear without any brown crossed out garbage until the end of contact.

Sent a couple of logs to Rick.

Good show Rick & Co.

73, Deme, VE7CRT.

As described in the help.... The ARQ mode will display data the same as FEC (green for corrected text red strike through for uncorrected text) When you are disconnected. When you are connected to another station it will only show BOLD black text which is always correct.

From: Lee Swanson
Topic: 1504 Message: 1506

VE7CRT reported that his station went into continuous CWID shortly after ending a V4 qso. Last night I heard the station of K1CT out in San Diego doing the same thing but unfortunate for him, he was away from the shack and it went on for 5 to 10 minutes. I looked up his phone number in the white pages and left him a message. He was quick to respond to the issue. So that makes two stations having the CWID issue. I'm sure that bug will be squashed in short order..

I really need to see the V4 TNC debug log file from one of those stations experiencing a continuous CW ID. There is no way I can track down that type of error without that log.

I have been working on a WINMOR TNC update the past several days so I haven't been doing much on the V4 but I should have another update in a few days.

Hi Paul:

I usually monitor 7073. It sometimes get QRMafter 0000Z with SSB but can
also QSY just above the JT65 Guys at 7076

Seems I have seen 3573 mentioned also but not sure on that one.

Give me a Zulu time frame and I can listen for you.

I also use the K3UK digital sked page mentioned earlier here to
establish QSY etc.

Cheers

Curt
KU8L

1511. High T>R Latency in V4Chat ARQ mode

Yahoo group: V4Protocol
Date: 2011-08-05 15:56:01 UTC
From: Demetrius Panaioti
Topic: 1511 Message: 1511

Although I've had several successful ARQ mode qso's, I've been getting High T>R latency indications. On the TNC window the latency is over 200ms most of the time and exceeds 250ms occasionally. In one of the debug logs, I observed a T>R latency of 284ms.
Will read the 'Troubleshooting' section in the virtual TNC section of help files to see what I can do to lower latency.

To date, the high latency hasn't caused with data transfer (I think)!

73, Deme, VE7CRT.

Deme,
The program is set up with some margin. It really will start failing when the latency gets over 300 ms which is why I set the spec limit at 250 ms. I don’t believe however there is any good reason why it shouldn’t be lower than 250 ms unless you have some of the problems discussed in the trouble shooting section.

1514. Re: V4 QSO's

Yahoo group: V4Protocol
Date: 2011-08-05 18:33:56 UTC
From: Bob Thornton
Topic: 1477 Message: 1514

Here is a list I posted back in June when this question was asked, that didn't seem to get too much argument. 7073 is outside our European bandplan though it probably won't stop us responding if we hear a call on a clear channel! WSPR is certainly open on 40mtr between Europe and Australia in our late evenings.

Quote from Message 1162:
I once(February??) found a page from a US state digital group which had a good list but I lost the link! What I noted down was :

Europe
3590 7040 10136

USA
3583 7073 10131

Worldwide
14073 18085 21073

hopefully others will add to this or correct any errors, as it is pure hearsay.

Bob

Topic: 1511 Message: 1515

Hi Folks,

I just set up V4 with my Icom 7000 and am getting a latency of around 30-50mS on ARQ CQ or call. Much better than my Flex 1500 which is around 450mS!

All I need now is some decent DX propogation. I already logged WB2QLL calling CQ yesterday but was out the shack!

73, Chris ZL1BOE

P.S. Any other ZL's or even VK's on V4? Maybe we could try 80 or 40..

The challenge is < 180 ms. I use a Flex 3000 and use the settings suggested in the RMS Express Help for Flex radios and my Latency is abt 130 to 150, but V4 contacts are RARE, yet RMS Express is virtually perfect depending on propagation.

Rick, I am using a FLex SDR1000 with software version 2.2.1.
Here are the settings that I am currently using for VAC.
Driver Windows WDM-KS
Buffer size: 512
Sample Rate: 48000
Latency set for Manual 10 ms.
Also, the Transmit DSP settings are RX 1024 and TX 1024.
If I call CQ in the ARQ mode the Measure T>R Latency is always between 200 and 230 MS.
ARQ mode has never worked for me. I have had many FEC contacts.
Yes, I understand how to use CTL CR.
Has anyone using a Flex radio been able to use the ARQ mode yet?
Thanks for all the work you have done.

From: Demetrius Panaioti
Topic: 1511 Message: 1520

Hi Rick,
I think I found my high latency problem.
I moved V4Chat from my laptop which has umpteen resident programs to a desktop with an I5 quad processor and significantly fewer programs.
Working V4Chat from the desktop, the T>R latency runs between a minimum of 80ms to a maximum of 130ms with the same Signalink USB soundcard and TS2000 radio.
The next step is to uninstall all the redundant programs on the laptop to see if the number of resident programs slowed down the laptop.
Cheers, Deme, VE7CRT.

1525. V4 Chat 0.4.4.0 Posted on Yahoo FTP

Yahoo group: V4Protocol
Date: 2011-08-06 19:19:43 UTC
From: kn6kb
Topic: 1525 Message: 1525

All,

This is a significant update that should solve some of the observed problems. Note also there is now a green Queue Data button which does essentially the same as the Ctrl + CR does.

Thanks to those that reported debug logs that helped me track down an error in the IRS>ISS logic.

Be sure and read the help files if there are questions.

As usual you will have to uninstall any existing version but no setup data wil lbe lost.

Good luck,

Rick KN6KB

Summary of changes since last release:

V4 Chat Revision History

Date: Rev Change Summary

Aug 6, 2011 0.4.4.0 Beta release of 0.4.3.1

Aug 5, 2011 0.4.3.1 Add Queue Data button (green on right) to mirror Ctrl + CR function
Add code to pickup call sign from selection in minilog to set target call sign via ARQ Call button
Remove Ctrl + C option for calling CQ or call sign (too confusing)..just use ARQ Call button
Add tool tip text to important buttons and text boxes.
Modify ARQ Call menu to eliminate reference to Ctrl + C
Update Help

V4 TNC Revision History

Date Rev # Summary ofChanges

Aug 6, 2011 0.4.4.0 Beta release of 0.4.3.2 no function changes to 0.4.3.2

Aug 6, 2011 0.4.3.2 Make important changes in mechanism of transition to IRS>ISS state. Using blnDataRcvdWhileIRS
should prevent possible IRS>ISS embrace observed.
Add Bandpass filtering using BPF1500B in SearchForAMLeader47B2 if filter currently not selected.
Data filtering and waterfall is still based on Filter setting. This improves sync detect accuracy.
Modify backcolor and text of Send CW ID to show if FSK CW is being used.
Update help.

Aug 4, 2011 0.4.3.1 Make backcolor of latency measurement green if <= 250 ms or red if > 250 ms
Modify SearchForAMLeader47B to use narrow filter on envelope for symbol framing.
Fix possible repeat of CW ID using blnSendingCWID
Add tool tip text

Topic: 1523 Message: 1526

Bob,

At one time I had that in there and it wasn’t that effective (almost always it would get a good decode on just the Viterbi FEC decode before scoring a good decode on the memory ARQ. I ran lots of tests (typically 1000 frames at –5 dB S/N multipath poor) . There have been a lot of changes since then so I should go back and revisit that again. The memory ARQ is “soft” using the soft symbol values (before binary quantization) prior to the Viterbi decoder which gives the best performance but it showed no significant improvement during my earlier tests. It may be in part to the interleaving used in the Viterbi processing which tends to spread errors widely through the frame prior to decoding with the Viterbi decoder. Viterbi works best with randomly spread errors vs blocks of errors.

Rick,

Thanks for the good explanation. I am also a WINMOR and PACTOR III user and have been impressed at how many times the memory ARQ in those protocols (also using Viterbi encoding I believe) seems to have saved the QSO when all else failed. It would eventually be interesting to see if memory ARQ becomes of any value as V4 evolves to be robust in other areas.

Ron,

Well too early to count the “chickens” yet but it sounds like it is a step in the right direction. The protocol (like all protocols) is tricky in a few areas and one of the testers captured a fairly rare but possible “embrace” where the two stations both got caught in the same place of the state table...NOT GOOD. The fix (which is in this latest rev) was fairly simple but I think was the cause of a lot of problems where the IRS didn’t complete the switch to ISS.

Also the fix I put in for the sensitivity is the result of the work on the WINMOR TNC. Though they are different in some respects the initial leader detection and symbol sync are quite similar. (46 baud two tone leader vs a 93 baud two tone leader for WINMOR) It looked to me like it helped probably 3-5 dB on the initial signal acquisition. Unfortunately my HF simulator only goes down to –5 dB S/N (3 KHz noise bandwidth) multi path poor channel but I was still getting about a 75% data frame success rate on that “channel”. That is a pretty poor signal but we do sometimes see a lot worse.

Few realize that progress in this HF modem game usually comes in little bytes of 1-2 dB! ....and the occasional back slide of a few dB!

73, Thanks for the feedback.

Rick KN6KB

Rule #1: Don’t cast off the lines until you start the engine!
No one else has reported this. I have all the latest anti viral software on both my computers. I downloaded and unzipped the zip file from the Yahoo web site to two computers and both unzipped and installed correctly.

You might try disabling the scanning or using a different virus scanner. I am virtually certain the file is clean.

Topic: 1521 Message: 1535

The V4 software sets the sample rate of the sound card (or VAC) you have assigned to 48000 receive, 12000 playback. I would suggest not using the rate of 44100 anywhere in a SDR setup. Most sound cards are NOT accurate at that sample rate (we have tested a lot) the primary rates of 192000, 96000, 48000, and 12000 are almost always more accurate. Look at one of the recent posts for the Flex 1000 and Flex 5000 for samples.

Others have had success using various flex models for both V4 and WINMOR (both have the same sample and playback rates).

Rick,

The only problem is that I've still be unable to have a two way (ARQ) QSO. I'm probably not asking this question correctly but as you can see I have my sample rate set to 44100. Is the correct sample rate for V4?

1537. NO JOY WITH ARQ VER 0.4.4.0

Yahoo group: V4Protocol
Date: 2011-08-07 05:27:24 UTC
From: Chris
Topic: 1537 Message: 1537

I have been testing with Chuck WA7BRL. Both of us using ver 0.4.4.0.

I can copy him 100% on FEC and he has had some copy from me on FEC but my signal is I think much weaker at his end.

We have linked several times on ARQ - sometimes initiated by me and sometimes by him. But no traffic has been exchanged either way at all. When I have initiated the link and am ISS I can queue text and see it sent. But Chuck says nothing arrives his end.

I will be trying within next few days to work with a local station and see if we have better results on ARQ.

73, Chris ZL1BOE

PS my latency is around 40mS during linking attempts.

Chris and All; Thanks for the testing. It seems linking (Connecting) on ARQ using REV. 0.4.4.0 is consistent between my station in Washington State to you in NZ on 20 Meters. My printing seems to very from 100% down to 25% with the QSB while on FEC mode but don't recall seeing any print while in ARQ. Also MY outgoing traffic does not show up in the Queue when in ARQ mode. During FEC mode, the Queue works fine and counts down as the traffic is sent after a Ctr-Enter. Is it not suppose to do so in ARQ mode?

When both of us first connect in ARQ mode, we get the ping pong effect with ACKS and NACS which I would expect while it is looking for traffic in the Queue. I'm not sure yet why it does not see the traffic in the text area or how to enter it into the Queue. Time to look at the HELP files again.

My latency has never gone over about 109 and averages in the 70's, so we are both well within the limits.

Good luck with a more local station.. it could just be signal strength on my end which is just about noise level or slightly above on a good QSB swing..

73;
Chuck, WA7BRL

From: Rick Muething
Topic: 1537 Message: 1540

John/All,

Your Outgoing Queue won't show up on the count until you are the ISS. The data is still there in a buffer but it is not UNTIL you are the ISS that the count is shown and begins to count down. This is all to insure that when you are the IRS you don't try and switch to the ISS UNTIL the ISS sends an IDL indicating he is done. Its just the same as a conversation...there should only be one talker at a time.

The data is sent the same in FEC mode as in ARQ mode. the only difference is that ARQ mode requires that the sync contains the proper session ID (an 8 bit number derived from the two connected call signs) If you can copy in FEC mode but not in ARQ mode I need to see your V4 TNC debug log. That tells me volumes more than any word description.... Programming especially this protocol development is ALL about details.... That is what the debug log is for. Send the V4 debug log AS AN ATTACHMENT to me directly with some indication (UTC time and description) of what you observed.

73,
Rick KN6KB

Rick,

As an experiment, I picked 44100 based upon an article I read in the Flex Knowledge base. See: http://kc.flexradio.com/KnowledgebaseArticle50504.aspx However, making this setting didn't help or effect the ability for ARQ ops. Nonetheless, I will adjust the VAC assignment back to 48000.

You make mention that "others have had success using various Flex models for both V4 and WINMOR. I know two Flex Radio users who have had success with WINMOR. Myself and Ted-KC3OL. Ted uses a SDR-1000 and I use the Flex-5000A. Ted and I have tested and continue to test V4. We have never been successful using V4 with ARQ. If you could be specific as to who those "Others" are we sure would like to talk with them.

1542. Re: [V4Protocol] Re: Memory ARQ implemented?

Yahoo group: V4Protocol
Date: 2011-08-07 12:00:24 UTC
From: Rick Muething
Topic: 1523 Message: 1542

Bob,
Your question got me to thinking and looking back at my previous MEMARQ tests on V4. I was using a fairly basic averaging algorithm to simply averaging the soft symbols upon each failed CRC check. In hindsight I think there is a much better approach.

With each received frame a “score” of 0- 100 is calculated. that score measures basically the average symbol quality (how closely the symbols “fit” onto the 4 perfect “corners”. This score is shown on the constellation diagram with each received data frame (whether correctly decoded or not)

The idea is to use that score to determine when/if to average the received (but failed CRC) soft symbols into the Memory ARQ. Using the score will insure the average is always improving in score and will discard any received frames that won’t improve the memory ARQ average score.

It will take a while and some extensive testing (long sessions over the HF Simulator on poor channels) to see how effective it is. It certainly won’t hurt and I should be able to gather some statistics to determine how useful it is.

Thanks again for the feedback.

Rick KN6KB

1543. Re: [V4Protocol] Flex settings.

Yahoo group: V4Protocol
Date: 2011-08-07 12:18:12 UTC
From: Rick Muething
Topic: 1521 Message: 1543

Kirk,

I would have to go back in the message history of the V4 group to pull out Flex users with success on V4 but I am pretty certain there are some. If the flex setup works with WINMOR the same setup should work with V4 (the latency limits are the same and the sample rates and playback rates are the same).

I can't emphasize enough the importance of the debug log. Comments like "We have never been successful using V4 with ARQ. " basically tell me very little. What WILL help me to find the problems you are seeing is something like this:
"Ted and I tried to connect at 2015 UTC. The attached V4 TNC debug logs from both our ends cover the period"

for example there is just one segment of the V4 TNC Debug log that tells the complete sync decode history for a frame. It looks like this:

2011/08/06 15:23:03.65 [0.4.2.1] New ARQ State: ISSSync
2011/08/06 15:23:03.86 [0.4.2.1] [ProcessSymbol] Raw Ptr Adj:7
2011/08/06 15:23:03.86 [0.4.2.1] [ProcessSymbol] Limited Ptr Adj:7 ID:2230 FEC:201 ACK:025 NAK:342 IDL:345
2011/08/06 15:23:03.86 [0.4.2.1] [ProcessSymbol] Successful Sync Distance History: FEC, ACK, NAK, IDL
2011/08/06 15:23:03.86 [0.4.2.1] DistFEC: 402 453 439 425 477 516 458 471 603 594 418 201
2011/08/06 15:23:03.86 [0.4.2.1] DistACK: 402 453 439 425 420 465 398 414 559 550 460 025
<<<< Notice the 025 here. It shows a good ACK decode
2011/08/06 15:23:03.86 [0.4.2.1] DistNAK: 402 453 439 425 477 464 393 413 561 545 356 342
2011/08/06 15:23:03.86 [0.4.2.1] DistIDL: 402 453 439 425 477 512 452 473 601 593 466 345
2011/08/06 15:23:03.86 [0.4.2.1] Ptr Adj: 015 -15 -14 003 015 003 004 003 000 001 000 007
<<<< This line shows the symbol sync tracking on a symbol by symbol basis.

I know it looks like gibberish to most but those distance numbers in the matrix show the decoding. See the 025 at the end of the DistACK line? That confirms how well the ACK sync was detected...a "distance" of < 100 is a good decode

I don't expect casual users to be able to interpret these things but all that is needed is to include the V4 TNC debug log AS AN ATTACHMENT with some time pointer...the UTC Time (notice the time is logged to the nearest 10 ms in the log snippet above) so I can efficiently zero in on the area without wading through many KB of log data. At this stage of the development this by far the most productive way to proceed.

73,

Rick KN6KB

Rick,

Neither Ted nor I have problem, supplying you with a debug log. However, KB5XE and I did this a few weeks back and never did hear any comment other than you didn't understand the problem. Ted, KC3OL and I, using the latest V4 TNC release, will attempt to establish a V4, ARQ QSO. I'll coordinate with Ted and get his debug log. I will send you a direct email with both our logs attached. Within my email, the exact (UTC) time of our attempt will be noted. We should be able to accomplish this before noon (CST), today.

Subject: Re: [V4Protocol] Flex settings.

The V4 software sets the sample rate of the sound card (or VAC) you have assigned to 48000 receive, 12000 playback. I would suggest not using the rate of 44100 anywhere in a SDR setup. Most sound cards are NOT accurate at that sample rate (we have tested a lot) the primary rates of 192000, 96000, 48000, and 12000 are almost always more accurate. Look at one of the recent posts for the Flex 1000 and Flex 5000 for samples.

Others have had success using various flex models for both V4 and WINMOR (both have the same sample and playback rates).

1545. Re: [V4Protocol] Flex settings.

Yahoo group: V4Protocol
Date: 2011-08-07 12:59:05 UTC
From: Ted Trostle
Topic: 1521 Message: 1545

I run the Flex 3000. I have had only limited success. One thing I have noted with the Flex radio is that the V4 performance can be impaired if the ALC is even 0 db. By monitoring the signal I hear distortion if the VAC TX Gain setting drives the ALC into 1 or 2 db. I set the PWSDR VAC TX Gain to limit the ALC to -1 db.

Under good propagation I have perfect contacts using RMS Express, so the V4 ARQ mode should work too, but again I believe performance overall is impacted by band conditions

Kirk my Flex settings are almost like those you posted earlier, except I have the VAC volume control disabled (unchecked) and all Sample Rates are 48000.

Where did you find PWSDR version 2.2 ?? I use version 2.1.5

From: K6KAR
Topic: 1521 Message: 1546

Ted,

Would you please expand upon "I have had only limited success." Have you ever accomplished an ARQ two way, QSO? I don't show ALC gain but will have to take a second look to see what ALC is present, if any. Most of my operation is digital so I'm very cognizant of problems caused by ALC. Anyway, your comment is a good one and one that I'll review on my system.

Having the VAC volume control enabled provides a little easier control of AF input and RF output when in DIGU or DIGL. Also, running sample rates at 44100 was an experiment. I'll be changing this back to 48000.

PWSDR version 2.2.1 is a beta release and hasn't yet been posted for general use. However, preliminary results are that it works very well and does have improved notch capability. It should be out shortly.

Thanks for your comments,

Kirk, K6KAR

Kirk I have had 1 QSO that was really good. I have had many OSO's start out OK, but they ended poorly when I timed out or the other station timed out and that was with V4 4.1 thru 4.3. No luck yet with the latest version 4.4

I believe I missed something about the VAC settings, perhaps you can point me to the answer...when I have the VAC volume control on I have no output. So what setting should I change or turn on?

Thanks Kirk,

Sometimes I get behind on processing requests and analyzing debug logs. It can take an hour or more of pouring through a debug log. Some days I get several often with little annotation or pointers as to where or what the problem observed was.

I'll gladly take a look. I am in the process now of gather some stats from my "local" connection across the desk through the HF Simulator. It allows a long and repeatable test and a way to gather good statistics.

Hiya Rick,

I was in QSO this morning with John, W2KI. V4Protocol worked fine. However, I believe there was
another station on the frequency that made for more re-tries. I thought that I had not received
part of John's comments but I had. The problem was that the V4 did not scroll to the bottom of the window. I didn't realize this until I looked at the scroll bar on the right and noticed there
was more info that I hadn't seen. No big deal but thought I'd mention it. Just something to watch
for.

I meant to mention to Rick that it occurs in ARQ connected mode with Black
Rich characters. It doesn't seem to happen
when not connected.

Thanks for covering my back Curt. I looked thru the help files for some info
that I can control scrolling but didn't see anything.

Maybe we'll catch up on 14073 dial sometime. Bands aren't too good into W1
land today.

Yes I have observed that...Its just the Session text box is not auto scrolling (nothing is really AUTO in programming unless you tell it to be!!!). There is a trade off here though....if you auto scroll with each new input (keeping the newest at the bottom of the screen) then it is cumbersome to manually scroll back up (e.g. to re read past text) since each new received data will scroll back to the bottom. Maybe putting some delay on the auto scrolling...say waiting 10 seconds after a manual scroll would work. I'll have to think about that. Its really just GUI fluff but I agree it is sometimes annoying to not see the data as it comes in.

I'm sure its something I'll get used to. This was my third QSO on V4. Two were with Ray, KB0E. Unfortunately I was new
to this and had problems understanding the ISS>IRS and IRS>ISS changeover. We also had interference from another
station on the frequency. Hopefully propagation improves soon.

But I'm learning. Thanks for a neat communications package Rick,

HI Fred..No problem. Sometimes its good to get corroboration from another user so it is less likely it is pilot error. No guarantees tho :)

It happens here in all modes...FEC, ARQ..I usually leave the setup monitoring in FEC mode and it does it alot. At first I thought perhaps when the PC went to screen saver it caused it, but it does it while I am there watching also.

Condx have been sooo poor lately. We'll connect soon.

Thanks

1556. RE: [V4Protocol] Flex settings.

Yahoo group: V4Protocol
Date: 2011-08-07 16:06:37 UTC
From: K6KAR
Topic: 1521 Message: 1556

Ted,

When you check VAC volume control and use DIGU or DIGL; this will give you direct ability to control (I/O) how much audio you are running through VAC. As for an example, let's say you are receiving V4 but the audio isn't quite high enough as indicated by the V4 signal strength indicator. Let's also say that your Flex receive controls are set at the point you find most comfortable. Now, all you have to do is use the DIGU (RX Gain) slider and increase received gain to V4. Using the DIGU/L sliders will allow you to control the I/O levels verses having to tweak setup values. Similarly, you can control transmit output by using the TX Gain slider. Obviously, this discussion is a little beyond the scope and intent of the V4 reflector. If I've thoroughly confused you, send me your telephone number. I'll call and walk you through it.

Kirk I have had 1 QSO that was really good. I have had many OSO's start out OK, but they ended poorly when I timed out or the other station timed out and that was with V4 4.1 thru 4.3. No luck yet with the latest version 4.4

I believe I missed something about the VAC settings, perhaps you can point me to the answer...when I have the VAC volume control on I have no output. So what setting should I change or turn on?

Ted, WB2LOU

On Sun, Aug 7, 2011 at 9:21 AM, K6KAR <kirk.harding@...> wrote:

Ted,

Would you please expand upon "I have had only limited success." Have you ever accomplished an ARQ two way, QSO? I don't show ALC gain but will have to take a second look to see what ALC is present, if any. Most of my operation is digital so I'm very cognizant of problems caused by ALC. Anyway, your comment is a good one and one that I'll review on my system.

Having the VAC volume control enabled provides a little easier control of AF input and RF output when in DIGU or DIGL. Also, running sample rates at 44100 was an experiment. I'll be changing this back to 48000.

PWSDR version 2.2.1 is a beta release and hasn't yet been posted for general use. However, preliminary results are that it works very well and does have improved notch capability. It should be out shortly.

Thanks for your comments,

Kirk, K6KAR

Subject: Re: [V4Protocol] Flex settings.

I run the Flex 3000. I have had only limited success. One thing I have noted with the Flex radio is that the V4 performance can be impaired if the ALC is even 0 db. By monitoring the signal I hear distortion if the VAC TX Gain setting drives the ALC into 1 or 2 db. I set the PWSDR VAC TX Gain to limit the ALC to -1 db.

Under good propagation I have perfect contacts using RMS Express, so the V4 ARQ mode should work too, but again I believe performance overall is impacted by band conditions

Kirk my Flex settings are almost like those you posted earlier, except I have the VAC volume control disabled (unchecked) and all Sample Rates are 48000.

Where did you find PWSDR version 2.2 ?? I use version 2.1.5

Ted, WB2LOU.

On Sun, Aug 7, 2011 at 8:18 AM, Rick Muething <rmuething@...> wrote:

Kirk,

I would have to go back in the message history of the V4 group to pull out Flex users with success on V4 but I am pretty certain there are some. If the flex setup works with WINMOR the same setup should work with V4 (the latency limits are the same and the sample rates and playback rates are the same).

I can't emphasize enough the importance of the debug log. Comments like "We have never been successful using V4 with ARQ. " basically tell me very little. What WILL help me to find the problems you are seeing is something like this:

"Ted and I tried to connect at 2015 UTC. The attached V4 TNC debug logs from both our ends cover the period"

for example there is just one segment of the V4 TNC Debug log that tells the complete sync decode history for a frame. It looks like this:

2011/08/06 15:23:03.65 [0.4.2.1] New ARQ State: ISSSync

2011/08/06 15:23:03.86 [0.4.2.1] [ProcessSymbol] Raw Ptr Adj:7

2011/08/06 15:23:03.86 [0.4.2.1] [ProcessSymbol] Limited Ptr Adj:7 ID:2230 FEC:201 ACK:025 NAK:342 IDL:345

2011/08/06 15:23:03.86 [0.4.2.1] [ProcessSymbol] Successful Sync Distance History: FEC, ACK, NAK, IDL

2011/08/06 15:23:03.86 [0.4.2.1] DistFEC: 402 453 439 425 477 516 458 471 603 594 418 201

2011/08/06 15:23:03.86 [0.4.2.1] DistACK: 402 453 439 425 420 465 398 414 559 550 460 025 <<<< Notice the 025 here. It shows a good ACK decode

2011/08/06 15:23:03.86 [0.4.2.1] DistNAK: 402 453 439 425 477 464 393 413 561 545 356 342

2011/08/06 15:23:03.86 [0.4.2.1] DistIDL: 402 453 439 425 477 512 452 473 601 593 466 345

2011/08/06 15:23:03.86 [0.4.2.1] Ptr Adj: 015 -15 -14 003 015 003 004 003 000 001 000 007 <<<< This line shows the symbol sync tracking on a symbol by symbol basis.

I know it looks like gibberish to most but those distance numbers in the matrix show the decoding. See the 025 at the end of the DistACK line? That confirms how well the ACK sync was detected...a "distance" of < 100 is a good decode

I don't expect casual users to be able to interpret these things but all that is needed is to include the V4 TNC debug log AS AN ATTACHMENT with some time pointer...the UTC Time (notice the time is logged to the nearest 10 ms in the log snippet above) so I can efficiently zero in on the area without wading through many KB of log data. At this stage of the development this by far the most productive way to proceed.

Subject: RE: [V4Protocol] Flex settings.

Rick,

As an experiment, I picked 44100 based upon an article I read in the Flex Knowledge base. See: http://kc.flexradio.com/KnowledgebaseArticle50504.aspx However, making this

setting didn't help or effect the ability for ARQ ops. Nonetheless, I will adjust the VAC assignment back to 48000.

You make mention that "others have had success using various Flex models for both V4 and WINMOR. I know two Flex Radio users who have had success with WINMOR. Myself and Ted- KC3OL. Ted uses a SDR-1000 and I use the Flex-5000A. Ted and I have tested and continue to test V4. We have never been successful using V4 with ARQ. If you could be specific as to who those "Others" are we sure would like to talk with them.

Subject: Re: [V4Protocol] Flex settings.

The V4 software sets the sample rate of the sound card (or VAC) you have assigned to 48000 receive, 12000 playback. I would suggest not using the rate of 44100 anywhere in a SDR setup. Most sound cards are NOT accurate at that sample rate (we have tested a lot) the primary rates of 192000, 96000, 48000, and 12000 are almost always more accurate. Look at one of the recent posts for the Flex 1000 and Flex 5000 for samples.

Others have had success using various flex models for both V4 and WINMOR (both have the same sample and playback rates).

Ok Curt,

Not having used V4 in the past I'm just not used to what to expect. It keeps this OLD mind moving Hi Hi.
I am going to learn how to spell SCROLLING tho.....
Did you see Rick's response ??

I tried RMS Winmor this morning but I couldn't get a connect. I'm assuming its propagation. Even my next door
neighbor DoC, W1EO wouldn't connect. He's about 7 air miles from me. We've had thunderstorms lately so
I'm assuming he shut down. I've been keeping an ear out so I can disconnect my antennas.

Be looking for you on 20.

Fred, W1WYC

From: Ted Trostle
Topic: 1521 Message: 1559

Yes while this is a bit "beyond the scope of the V4 reflector" other Flexers may need the info.

OK I found the problem...enabling the VAC volume control conflicts with the sound card mixer in my PC. So by disabling the volume control, I have access to audio and TX Gain via the VAC panel in PWSDR...the other way means I have to get into the mixer settings and I would rather leave it set where it is balanced such I can run other digi modes smoothly.

I did find my RX Gain settings was way too low for V4 so now I hope to do better.

If you click in the text entry portion of the window, the received text window in ARQ mode scrolls OK. Took me a while to find this. Of course, as soon as you click elsewhere, the scrolling stops.

Fred, I thought we were having far too many retries for your having such a great signal and scores. You had mentioned that my scores were also in the 90s, so I sent my logs to Rick.

All in all, 0.4.4.0 is MUCH better as far as protocol issues are concerned (i.e the ability to actually transfer data and change between ISS/IRS). I do find that the V4 narrow filter helps at my QTH, as does lowering the squelch/decode sensitivity to below the default 5. I seem to have to adjust the value depending on changes in band conditions, even during a QSO.

73, and thanks for everything, Rick. V4 is really coming together!

Dick, W4WEB, HI... I think all the bands are flakey right now with the solar flare occurring. I saw you on 14.073 this morning while monitoring on FEC.. I was not at the radio at the time but later tried a call with no results. I just tried 10.131 and no connect to your station on ARQ. Another day maybe.

Ok John,

Good to know about the scrolling. I'll give it a shot. Also about sending the logs to Rick. I'll see what I have down cellar which is where the radio is. I can copy the log files to this pc and then send them to Rick. I'll work at it. The times should correlate since the pc clock is sync'd from the internet.

Yup. your signal was very good and like you said the scores were in the 90's.

I've really just started using V4 so I can't say anything about previous releases.

Catch you again on 14073,
73,
Fred, W1WYC

You're right. There have been times when I've wanted to look back at the received info and in order
to do so i have had to disable the input so I don't have any new data coming in. If as John says "With the cursor in the text
entry window the received text will scroll". That would be fine also.

Fred, W1WYC

Subject: Re: [V4Protocol] Scrlloing

Yes I have observed that...Its just the Session text box is not auto scrolling (nothing is really AUTO in programming unless you tell it to be!!!). There is a trade off here though....if you auto scroll with each new input (keeping the newest at the bottom of the screen) then it is cumbersome to manually scroll back up (e.g. to re read past text) since each new received data will scroll back to the bottom. Maybe putting some delay on the auto scrolling...say waiting 10 seconds after a manual scroll would work. I'll have to think about that. Its really just GUI fluff but I agree it is sometimes annoying to not see the data as it comes in.

Read the help. You must have a received signal strength about halfway into the green on background noise to get a good T>R Latency measurement. I assume you are not working full duplex. The algorithm measures the time from PTT release until it sees background noise.

You don’t need to measure this every call...Once is fine unless you change major settings.

Thank you for the prompt reply, Rick.

I did re-read the help, ran some tests and indeed, the T>R latency bar does not display. I tried various settings on the audio into the soundcard to no avail.

Best we see if someone else has the issue. I am controlling PTT via COM1 using a homebrew opto-isolated interface.

Subject: [V4Protocol] V4 Chat 0.4.4.0 Posted on Yahoo FTP

All,

This is a significant update that should solve some of the observed problems. Note also there is now a green Queue Data button which does essentially the same as the Ctrl + CR does.

Thanks to those that reported debug logs that helped me track down an error in the IRS>ISS logic.

Be sure and read the help files if there are questions.

As usual you will have to uninstall any existing version but no setup data wil lbe lost.

Good luck,

Rick KN6KB

Summary of changes since last release:

V4 Chat Revision History

Date: Rev Change Summary

Aug 6, 2011 0.4.4.0 Beta release of 0.4.3.1

Aug 5, 2011 0.4.3.1 Add Queue Data button (green on right) to mirror Ctrl + CR function
Add code to pickup call sign from selection in minilog to set target call sign via ARQ Call button
Remove Ctrl + C option for calling CQ or call sign (too confusing)..just use ARQ Call button
Add tool tip text to important buttons and text boxes.
Modify ARQ Call menu to eliminate reference to Ctrl + C
Update Help

V4 TNC Revision History

Date Rev # Summary ofChanges

Aug 6, 2011 0.4.4.0 Beta release of 0.4.3.2 no function changes to 0.4.3.2

Aug 6, 2011 0.4.3.2 Make important changes in mechanism of transition to IRS>ISS state. Using blnDataRcvdWhileIRS
should prevent possible IRS>ISS embrace observed.
Add Bandpass filtering using BPF1500B in SearchForAMLeader47B2 if filter currently not selected.
Data filtering and waterfall is still based on Filter setting. This improves sync detect accuracy.
Modify backcolor and text of Send CW ID to show if FSK CW is being used.
Update help.

Aug 4, 2011 0.4.3.1 Make backcolor of latency measurement green if <= 250 ms or red if > 250 ms
Modify SearchForAMLeader47B to use narrow filter on envelope for symbol framing.
Fix possible repeat of CW ID using blnSendingCWID
Add tool tip text

1570. Re: NO JOY WITH ARQ VER 0.4.4.0

Yahoo group: V4Protocol
Date: 2011-08-08 02:16:53 UTC
From: Chris
Topic: 1537 Message: 1570

Hi Ron,

Happy to report I now have my friend Clive ZL1FZ on board with V4 and we have had some successful ARQ and FEC contacts on 14073 in spite of quite a difficult path (weak signals) between us. I look forward to working some VK's and further afield in the near future.

Ron, your work on a new ARQ chat system fills a reall need I believe and is highly appreciated. It should give PSK31 users an interesting alternative. And provide much better performance on the lower bands, polar paths, etc.

Just wondering if you would consider the following future enhancements:

1) An an option allow the ISS operator to decide when the link is turned over? As things are now any pause in typing results in the ISS having his "over" cut short. Likewise the ability for the RSS to force a premature turnover if/when needed?

2) An "echo as sent" option whereby the text entered by the ISS gets copied to the recieve pane only if/when it is acked/printedby the RSS. And something similar in FEC mode except that the characters would be copied across as they were actually sent to air.

3) Auto fall-back to FEC if ARQ drops out?

4) Any way that V4 could calculate and display propagation delay? The BMK multi software based Amtor/Pactor package attempted this.

5) With todays CAT controlled rigs maybe RF power could be dynamically controlled in ARQ to the minimum needed?

6) Is the ARQ/FEC mode button really necessary? Could the system not fall back to FEC whenever a link is not active? And be ready to link whenever a connect (to my station) message is detected? Likewise, if any data is sent via the cntrl-ent command could it not automatically be sent as FEC if no link and as ARQ if there is a link?

73, Chris ZL1BOE

>
> John/All,
>
> Your Outgoing Queue won't show up on the count until you are the ISS. The data is still there in a buffer but it is not UNTIL you are the ISS that the count is shown and begins to count down. This is all to insure that when you are the IRS you don't try and switch to the ISS UNTIL the ISS sends an IDL indicating he is done. Its just the same as a conversation...there should only be one talker at a time.
>
> The data is sent the same in FEC mode as in ARQ mode. the only difference is that ARQ mode requires that the sync contains the proper session ID (an 8 bit number derived from the two connected call signs) If you can copy in FEC mode but not in ARQ mode I need to see

your V4 TNC debug log. That tells me volumes more than any word description.... Programming especially this protocol development is ALL about details.... That is what the debug log is for. Send the V4 debug log AS AN ATTACHMENT to me directly with some indication (UTC time and description) of what you observed.

1571. Re: [V4Protocol] Re: NO JOY WITH ARQ VER 0.4.4.0

Yahoo group: V4Protocol
Date: 2011-08-08 05:31:11 UTC
From: Rick Muething
Topic: 1537 Message: 1571

Chris,
Thanks for the feedback. To address your questions:

1) An an option allow the ISS operator to decide when the link is turned over? As things are now any pause in typing results in the ISS having his "over" cut short. Likewise the ability for the RSS to force a premature turnover if/when needed?

The link is now turned over ONLY when:
The ISS has no data pending OB queue = 0 AND The IRS Does have data pending OB queue not 0. This is what allows a “chat” back and forth operation. If the ISS can block the changeover even if it has 0 data pending then the IRS can’t ever send.

You don’t need the IRS to force a turnover unless you implement the block above. If allowed that also causes a problem...what do you do with the unsent data in the ISS queue (Dump it? Wait until he is ISS again? Its all possible but I think can be very confusing to users which sometimes seem to have enough difficult with just the whole ARQ and IRS<>ISS concept.

2) An "echo as sent" option whereby the text entered by the ISS gets copied to the recieve pane only if/when it is acked/printedby the RSS. And something similar in FEC mode except that the characters would be copied across as they were actually sent to air.

I have a plan for this but it is tricky code. The best way is to change the font of the buffered text (the text that is now blue italic in the Session window) as the text is confirmed received. (if you just displayed it when sent or ACKed you couldn’t read what you had queued). for example the Blue italic text could be changed to Blue Italic bold as the sent characters are ACKed. This is doable and will work well but is not trivial code so I have put it off until we get the bugs (yes there are still some!) flushed out of the protocol . This is the area of GUI “fluff” and while nice takes a back seat to real problems.

3) Auto fall-back to FEC if ARQ drops out?

ARQ mode does display just like FEC if not connected. It is sending that is different. You could automatically send just FEC if you tried to send and weren’t connected but this might be more confusing to users. I would want to get a lot more feed back on something like that.

4) Any way that V4 could calculate and display propagation delay? The BMK multi software based Amtor/Pactor package attempted this.

Not practically with the timers and interrrupt resolution of the program and Windows. look at a typical 2000 mile path. That is something like 11 ms. The latency of the sound card, sound card interrupts, OS latency can all be considerably larger that 11 ms. So in practice you would be measuring the width of human hairs with a yardstick!

5) With todays CAT controlled rigs maybe RF power could be dynamically controlled in ARQ to the minimum needed?

Yes that is possible but the issue is this. In most cases with all things digital throughput (after FEC) is a function of signal quality (strength and distortion). You can lower the power but then unless the signals are very strong the throughput will also go down. (this all goes back to Shannon who related Channel capacity to S/N). I would say it would be more relevant if we were all running a KW but most are using 50 Watts or less. Dropping the signal say to 5 watts would make a significant impact on throughput in most typical channels.

6) Is the ARQ/FEC mode button really necessary? Could the system not fall back to FEC whenever a link is not active? And be ready to link whenever a connect (to my station) message is detected? Likewise, if any data is sent via the cntrl-ent command could it not automatically be sent as FEC if no link and as ARQ if there is a link?

This is really the same as 3) . It is possible to do it this way (receive already works this way) but I am concerned others using FEC can get confused. Maybe others would like to comment? This is not in the GUI fluff category but is an impact on the way users use the program. It is an easy program change to do this but it could cause confusion. E.g. You are for example “chatting” in a group of 3 with FEC. Then someone calls you on ARQ and you connect automatically. That disturbs and takes over your FEC session. One thing to remember: YOU CAN’T have simultaneous sessions running on the same frequency and expect success. It just like CW and SSB....One QSO on a frequency.

Thanks for the feedback and observations.

Rick KN6KB

Problem solved!

Rick, you might want to add a note in the help file. "If you are having problems getting the tx>rx latency measurement to display in the TNC window, temporarily disable the noise reduction feature on your radio, if enabled"

The following are tx>rx latencies that I measured:
-ICOM IC-735 using CAT running at 1200 bps: 80ms
-ICOM IC-746PRO using CAT running at 9600 bps: 47ms
-ICOM IC-746PRO using COM1 direct: 47ms

1574. Successful Vchat 0.4.4.0 qso with AE6LA Ken

Yahoo group: V4Protocol
Date: 2011-08-08 17:27:54 UTC
From: Demetrius Panaioti
Topic: 1574 Message: 1574

Connected to AE6LA at 02:51:45 on Aug 8 Z.
Ended at about 03:09Z
Noise level at VE7CRT was S1. AE6LA signal at VE7CRT S1 to S2.
Clear, consistent printing of received signals.
T>R latency was high 200ms to 250+ms. with the Vista 64 bit system.
Updated O/S to Windows 7 after qso. T/R latency with Windows 7 dropped by at least 50 ms.

Computer system: Intel core 2 duo T6400 @2.0GHz. 4GB(3.87 usable) of memory.

Latest version of V4 Chat performed flawlessly under difficult conditions.

1575. V4 Chat 0.4.4.0 - sucess at last

Yahoo group: V4Protocol
Date: 2011-08-08 17:57:32 UTC
From: Peter
Topic: 1575 Message: 1575

Hello everybody,

after many weeks of trying V4 Chat I have finally made a connect that lasted for more than a minute and which allowed me to exchange information with another station. Using the latest version I have just had a good 2-way ARQ contact with Tommi OH7JJT that lasted for 20 mins. At times we had strong qrm from a Hellschreiber signal just off frequency but remained connected.

I have been using digi modes for very many years and have a set up that works extremely well with every digi mode in current use. It has been very frustrating to hear signals that would have given 100% copy on any other mode and not being able to connect reliably to them.

My feelings during the weeks of tribulation were that the signal quality specifications given in the help file were far too onerous for stations like mine with modest power and poor wire antennas to stand any chance of making a contact. Band conditions are particularly poor and in nearly 60 years on the air I can not remember them being quite so bad at this phase of the sunspot cycle. Strong, stable, noise and interference free signals on 20m are but a pipe dream at this qth at the present time.

From my experience this evening, V4 Chat 0.4.4.0 has achieved a big improvement in robustness and I now look forward to making some more solid contacts with this mode.

Hopefully the improvement in reliability will encourage more activity.

Thanks Bernie. That makes good sense...it requires some noise level to detect (pretty hard to detect nothing!). I'll include that in the help.

>
> The link is now turned over ONLY when:
> The ISS has no data pending OB queue = 0 AND The IRS Does have data pending OB queue not 0. This is what allows a â□□chatâ□□ back and forth operation. If the ISS can block the changeover even if it has 0 data pending then the IRS canâ□□t ever send.
>
> You donâ□□t need the IRS to force a turnover unless you implement the block above. If allowed that also causes a problem...what do you do with the unsent data in the ISS queue (Dump it? Wait until he is ISS again? Its all possible but I think can be very confusing to users which sometimes seem to have enough difficult with just the whole ARQ and IRS<>ISS concept.
>
>
> 2) An "echo as sent" option whereby the text entered by the ISS gets copied to the recieve pane only if/when it is acked/printedby the RSS. And something similar in FEC mode except that the characters would be copied across as they were actually sent to air.
>
> I have a plan for this but it is tricky code. The best way is to change the font of the buffered text (the text that is now blue italic in the Session window) as the text is confirmed received. (if you just displayed it when sent or ACKed you couldnâ□□t read what you had queued). for example the Blue italic text could be changed to Blue Italic bold as the sent characters are ACKed. This is doable and will work well but is not trivial code so I have put it off until we get the bugs (yes there are still some!) flushed out of the protocol . This is the area of GUI â□□fluffâ□□ and while nice takes a back seat to real problems.
>
> 3) Auto fall-back to FEC if ARQ drops out?
>
> ARQ mode does display just like FEC if not connected. It is sending that is different. You could automatically send just FEC if you tried to send and werenâ□□t connected but this might be more confusing to users. I would want to get a lot more feed back on something like that.
>
> 4) Any way that V4 could calculate and display propagation delay? The BMK multi software based Amtor/Pactor package attempted this.
>
> Not practically with the timers and interrrupt resolution of the program and Windows. look at a typical 2000 mile path.

That is something like 11 ms. The latency of the sound card, sound card interrupts, OS latency can all be considerably larger that 11 ms. So in practice you would be measuring the width of human hairs with a yardstick!
>
> 5) With todays CAT controlled rigs maybe RF power could be dynamically controlled in ARQ to the minimum needed?
>
> Yes that is possible but the issue is this. In most cases with all things digital throughput (after FEC) is a function of signal quality (strength and distortion). You can lower the power but then unless the signals are very strong the throughput will also go down. (this all goes back to Shannon who related Channel capacity to S/N). I would say it would be more relevant if we were all running a KW but most are using 50 Watts or less. Dropping the signal say to 5 watts would make a significant impact on throughput in most typical channels.
>
>
> 6) Is the ARQ/FEC mode button really necessary? Could the system not fall back to FEC whenever a link is not active? And be ready to link whenever a connect (to my station) message is detected? Likewise, if any data is sent via the cntrl-ent command could it not automatically be sent as FEC if no link and as ARQ if there is a link?
>
> This is really the same as 3) . It is possible to do it this way (receive already works this way) but I am concerned others using FEC can get confused. Maybe others would like to comment? This is not in the GUI fluff category but is an impact on the way users use the program. It is an easy program change to do this but it could cause confusion. E.g. You are for example â□□chattingâ□□ in a group of 3 with FEC. Then someone calls you on ARQ and you connect automatically. That disturbs and takes over your FEC session. One thing to remember: YOU CANâ□□T have simultaneous sessions running on the same frequency and expect success. It just like CW and SSB....One QSO on a frequency.

1578. V4 here in Arctic Polar Circle

Yahoo group: V4Protocol
Date: 2011-08-09 09:19:34 UTC
From: Juhani
Topic: 1578 Message: 1578

Hello! Last version of V4 working quite good: tested on 40m by OH7JJT few times. Interface is "poor" because beta version and some "re-send" like ping-pong effect observed.
I'm on 14073 soon and later 7045. Also my friend OH7JJT will be QRV -om Tommi have holidays this week.
I use here in my "Holiday QTH" -about 2o miles north from Arctic Polar Circle- solar cell/battery powered "JUMA" station byt "minilaptop" HP mini 100e by internal/integrated Realtek soundcard and home made RS323 interface via USB port -and all working fine!
73 "Yussi" OH7TE/9 (I use call OH7TE on V4 and WM)

1580. New Update V4Chat 0.4.5.0 on Yahoo FTP

Yahoo group: V4Protocol
Date: 2011-08-09 12:39:05 UTC
From: kn6kb
Topic: 1580 Message: 1580

All,
This includes some important fixes and improvements. I have done extensive testing on this over several channel types.

Please let me know your results. I am working on another change that will improve sync sensitivity but I need more time for testing and evaluating that.

As usual uninstall your existing V4Chat and re install using the Setup file in the new zip file V4Chat 0.4.5.0 Full install.

If you have difficulties, note the UTC time observed, describe the problem as best you can and send me the V4TNC Debug log as an attachment.

Good luck,

Rick Muething, KN6KB

V4 Chat Revision History
Date: Rev Change Summary
Aug 9, 2011 0.4.5.0 Beta Release of 0.4.4.1

Aug 7, 2011 0.4.4.1 Fix reference to grid problem upon startup when Cell value is nothing.(logged exception).
Add Timeout mechanism (10 seconds) to Scroll to Caret after manual scroll. Insures new text is always shown in Session
Fix vertical splitter to never be larger than 470 after resize.
Do not allow frequency change on Grid click if ARQ Connected.

V4 TNC Revision History

Date Rev # Summary ofChanges

Aug 9, 2011 0.4.5.0 Beta release of 0.4.4.1

Aug 7, 2011 0.4.4.1 Added Session variable TargetCQ and logic to insure ignoring all ACKs when calling CQ.
Added Stats in Session for accumulating MEMARQRecoveries.
Added new MEMARQ scheme based on score to ProcessARQFrame for evaluation
Dequeue pending data when receceivd from host if ARQ IRS (shows on OB Queue pending)
Added global function ClearOBQueue
Added logic in ProcessIDLs to ignore IDL if ISS and OBqueue not empty.
Change IDL threshold to 100 (was 175)
Increment FramesSent statistic on repeated frames.
Modify noise base calculation in SearchForAMLeader47B2 to use 4 bin average
Select larger correlation of normal or fractional bins in SearchForAMLeader47B

I’m still making changes that affect compatibility with prior version and in those cases auto update is a real pain. Probably one or two more revs until auto update. Look at it this way ...it takes you about .2 % of the time I spend on generating the update to uninstall, download and reinstall the new version.

1583. Rcv Frame, Xmt Frame

Yahoo group: V4Protocol
Date: 2011-08-09 15:34:59 UTC
From: John Hirth
Topic: 1580 Message: 1583

Rick,

In watching the progress of recent V4 QSOs I find myself often glancing at the "Rcv Frame" and "Xmt Frame" boxes in the TNC window to see what type of frame I've just received or sent. But that information remains in the boxes for a very short time. It's often gone by the time I look for it.

Might it make sense to leave the information about the last frame type received and transmitted on the screen until the next frame has been decoded? The boxes could be changed to something like "Last Rcv Frame" (similar for Xmt).

Just a suggestion to help keep track of what is happening.

1584. 0.4.5.0 Received text window scrolling

Yahoo group: V4Protocol
Date: 2011-08-09 16:14:18 UTC
From: John Hirth
Topic: 1584 Message: 1584

With the cursor in the transmit text window the 10 second delay when you scroll back the received text window seems to work, unless new received text arrives during that time, at which point the received text immediately jumps back to the bottom. I'm not sure if this is intentional, but the jump seems awkward when you're trying to read something that came before.

Just a point of information.

John W2KI

1585. 0.4.5.0 strange cursor behavior

Yahoo group: V4Protocol
Date: 2011-08-09 16:34:06 UTC
From: John Hirth
Topic: 1585 Message: 1585

In Win7, re: RX and TX text windows.

In ARQ QSO, when receiving frames and typing into TX text box at the same time, the cursor jumps into the RX text window with each incoming frame. You have to click in the TX text window each time to get it back. (I was told by Ray, KB0E this morning that this doesn't happen in WinXP, only in WIn7).

When you transfer text to the outbound buffer with ctrl-c, the cursor follows the text into the RX window. You have to click on the TX window each time to bring it back. If you're sending a line or so at a time into the buffer to try to keep up with the outgoing frames, this is troublesome.

More for the list....

The whole operation of the scrolling of those windows is very tricky. What I tried was to basically insure you will see new text in the event you leave the window scrolled up. I don’t know how to make it work both ways (leave the window scrolled where it is AND automatically scroll it so you can see the new text) at the same time!

Hello rick
Do you know spotcollector soft?
If you scroll up in that soft there is a button scroll locked
now you have all time to read
if new spots come in the button changes colour and starts blinking in red
now push the scroll lock button and you are back at the lower end were the
new spots came in
maybe you could grab that idea
make a scroll lock and if new text make a blinking box or something like
that
greetz

Siegfried,
That’s a good solution I’ll look into it for the next rev.

Subject: AW: [V4Protocol] 0.4.5.0 Received text window scrolling

Hello rick
Do you know spotcollector soft?
If you scroll up in that soft there is a button scroll locked
now you have all time to read
if new spots come in the button changes colour and starts blinking in red
now push the scroll lock button and you are back at the lower end were the
new spots came in
maybe you could grab that idea
make a scroll lock and if new text make a blinking box or something like
that
greetz

1595. Measured T>R Latency jumping around

Yahoo group: V4Protocol
Date: 2011-08-09 23:54:41 UTC
From: Robert
Topic: 1595 Message: 1595

Rick,

While calling CQ, my version 0.4.5.0 TNC measured T>R latency is jumping all over from 100mSec to 1100mSec or so. I have measured the actual T/R recovery time from audio recorded at the radio and it is always around 25-30 mSec.

Audio receive level is in the middle of the TNC level bar. Computer is a recent quad-core running Windows 7. The radio is an Elecraft K3 and I have tried both using software TX/RX commands at 38.4kbaud and RTS to PTT on an additional com port.

Earlier versions of the TNC have also been showing the relatively long T>R times, but it seems worse in the last version.

Nothing in the exceptions log and not much in the debug log:

```
*** Freq Changed: 14073.00 KHz Dial
2011/08/09 22:58:46 {Status} *** Calling CQ de N7ZO
2011/08/09 22:59:16 {Status} * DISCONNECTED ARQ Timeout... Outbound buffer purged.
2011/08/09 22:59:48 {Status} *** Calling CQ de N7ZO
2011/08/09 23:00:17 {Status} * DISCONNECTED ARQ Timeout... Outbound buffer purged.
2011/08/09 23:00:24 {Rcv Txt Err} "hgrqZ=jjiy?
2011/08/09 23:00:45 {Status} *** Calling CQ de N7ZO
2011/08/09 23:01:15 {Status} * DISCONNECTED ARQ Timeout... Outbound buffer purged.
```

Please let me know if I can provide any further information.

I had some T>R measurement latency issues and they were caused by having noise reduction enabled in the Radio. Try temporarily turning off noise reduction (if you have it enabled) and re-run your tests.

Worth a try ...

Hi Bernie,

Noise reduction is off. Actually, with the K3 it is not possible to enable receive noise reduction (or xmit compressor) when the radio is in DATA mode. But thanks for the idea.

What else is running? Kill all but the V4 app. Kill wireless and the virus and malware programs (I mean KILL), see http://technet.microsoft.com/en-us/sysinternals/bb896653 .

You will, likely, fidf all sorts of apps that are loaded by the Start menu or in the registry. KILL all of them and take a look at latency, then work your way back up the tree.

Bob

I wonder if you have a DPC problem. Try running this:

http://www.thesycon.de/eng/latency_check.shtml

If it consistently reports DPC times much greater than 500uS, this could
be the cause of your problem.

A common factor leading to very long DPC times is the WiFi system. If
you have WiFi turned on, try turning it off.

Anti-virus software can be another cause of long DPCs.

1604. Important V4Chat Update 0.5.0.0

Yahoo group: V4Protocol
Date: 2011-08-10 18:52:08 UTC
From: kn6kb
Topic: 1604 Message: 1604

All,

Sorry for some of the glitches noted in the user interface on Version 0.4.5.0. This fixes all that and also increases the weak signal robustness using a 2 symbol sync extension. That makes this incompatible with prior versions so the move to the next major revision .5. Please update to this to continue testing. Version .5 will not be able to connect with lower versions.

73 and thanks for your patience!

Rick KN6KB

V4 Chat Revision History

Date: Rev Change Summary

Aug 10, 2011 0.5.0.0 Beta Rlease of 0.4.5.1

Aug 10, 2011 0.4.5.1 Fixed problem with loosing Keyboard RTB focus on Session update
Add button Scroll Locked and mechansim for buffering rtbSession updates when scrolled.
Remove timer on scroll and Scroll to Caret.

4 TNC Revision History

Date Rev # Summary ofChanges

Aug 10, 2011 0.5.0.0 Beta release of 0.4.5.1

Aug 10, 2011 0.4.5.1 Change sync symbols from 6 to 8. Gives minimal code distance of 4 for each sync type.
Change ProcessSymbol, Mod1Car4FSK47B, Mod1Car4FSKAckNakIDL to accomodate sync change
Change Sync distance thresholds: FEC=240,ARQ=240,ACK=200,NAK=240,IDL=200
Extended display time of Receivd label from 1500 to 3000 ms.
Identify repeated freames with "RPT:" and Violet back color in transmit label.

I have had the same problem. Using XP SP3 and latest 0.5.0.0.

Problem completely solved by disabling my Nod32 virus program.

Latency on my machine is <100uS.

>
> The link is now turned over ONLY when:
> The ISS has no data pending OB queue = 0 AND The IRS Does have data pending OB queue not 0. This is what allows a â□□chatâ□□ back and forth operation. If the ISS can block the changeover even if it has 0 data pending then the IRS canâ□□t ever send.
>
> You donâ□□t need the IRS to force a turnover unless you implement the block above. If allowed that also causes a problem...what do you do with the unsent data in the ISS queue (Dump it? Wait until he is ISS again? Its all possible but I think can be very confusing to users which sometimes seem to have enough difficult with just the whole ARQ and IRS<>ISS concept.
>
>
> 2) An "echo as sent" option whereby the text entered by the ISS gets copied to the recieve pane only if/when it is acked/printedby the RSS. And something similar in FEC mode except that the characters would be copied across as they were actually sent to air.
>
> I have a plan for this but it is tricky code. The best way is to change the font of the buffered text (the text that is now blue italic in the Session window) as the text is confirmed received. (if you just displayed it when sent or ACKed you couldnâ□□t read what you had queued). for example the Blue italic text could be changed to Blue Italic bold as the sent characters are ACKed. This is doable and will work well but is not trivial code so I have put it off until we get the bugs (yes there are still some!) flushed out of the protocol . This is the area of GUI â□□fluffâ□□ and while nice takes a back seat to real problems.
>
> 3) Auto fall-back to FEC if ARQ drops out?
>
> ARQ mode does display just like FEC if not connected. It is sending that is different. You could automatically send just FEC if you tried to send and werenâ□□t connected but this might be more confusing to users. I would want to get a lot more feed back on something like that.
>
> 4) Any way that V4 could calculate and display propagation delay? The BMK multi software based Amtor/Pactor

package attempted this.
>
> Not practically with the timers and interrrupt resolution of the program and Windows. look at a typical 2000 mile path. That is something like 11 ms. The latency of the sound card, sound card interrupts, OS latency can all be considerably larger that 11 ms. So in practice you would be measuring the width of human hairs with a yardstick!
>
> 5) With todays CAT controlled rigs maybe RF power could be dynamically controlled in ARQ to the minimum needed?
>
> Yes that is possible but the issue is this. In most cases with all things digital throughput (after FEC) is a function of signal quality (strength and distortion). You can lower the power but then unless the signals are very strong the throughput will also go down. (this all goes back to Shannon who related Channel capacity to S/N). I would say it would be more relevant if we were all running a KW but most are using 50 Watts or less. Dropping the signal say to 5 watts would make a significant impact on throughput in most typical channels.
>
>
> 6) Is the ARQ/FEC mode button really necessary? Could the system not fall back to FEC whenever a link is not active? And be ready to link whenever a connect (to my station) message is detected? Likewise, if any data is sent via the cntrl-ent command could it not automatically be sent as FEC if no link and as ARQ if there is a link?
>
> This is really the same as 3) . It is possible to do it this way (receive already works this way) but I am concerned others using FEC can get confused. Maybe others would like to comment? This is not in the GUI fluff category but is an impact on the way users use the program. It is an easy program change to do this but it could cause confusion. E.g. You are for example â□□chattingâ□□ in a group of 3 with FEC. Then someone calls you on ARQ and you connect automatically. That disturbs and takes over your FEC session. One thing to remember: YOU CANâ□□T have simultaneous sessions running on the same frequency and expect success. It just like CW and SSB....One QSO on a frequency.

From: Ron Wenig
Topic: 1595 Message: 1609

I'm glad I saw this note. The TS-590 has a built in sound card with vox using USB. I forgot that there is a vox delay setting. My latency went from 300 down to 117 by setting the vox delay to zero. The result was I had a very nice long V4Chat ARQ QSO with V31AE. Rick, I have to read that help section a little more :-)

Ron,

O wasn’t aware that Kenwood had a transceiver with a built in sound card (similar to the Icom 7200 and 7600) In the Icom you can still use PTT keying (CAT control) over the same USB cable...not sure if the Kenwood is like that. If you have a manual in electronic form on the TS-590 can you send it to me?

Thanks

Well, I upgraded to 0.5.0.0 and it no longer shows any latency readings for me. So I'm stumped for the moment.

I tried the DPC latency checker (Thanks Ian) and all readings were below 400uSec. And I was going to try disabling NOD32 etc. (thanks Tom and Chris), but since I am not getting any T>R latency numbers at the moment, there is no point in that.

Also, a note to Rick: On my PC (Windows 7, 1920x1200) the last two versions scroll the receive window such that 1/2 of the last line is consistently cut off by the bottom of the receive window.

Rick,

It's on the way. Yes, the ptt keying is handled by the same USB cable.
It uses a virtual com port driver that you can download from Kenwood.

Bob, All

The scrolling of the Rich text boxes is a little messy in Windows. They allow the box to be a non integral number of lines which can cut off all or part of the last text line. I will work on long term solution for this (it messy) but in the mean time you can (I confirmed this on several computers) find an adjustment of the Session text box height (by dragging the horizontal splitter) such that at least most of the last line of the session box is visible as it arrives.

This version (0.5.0.0) now also allows you to scroll up locking the auto scrolling. Incoming data is still captured and then displayed after scroll Locking is turned off (or times out after 30 seconds)

There were no changes whatsoever in the latency measuring code or technique in the last several versions.

Rick KN6KB

1616. CHAT MODE VERSUS QSO MODE

Yahoo group: V4Protocol
Date: 2011-08-10 22:54:18 UTC
From: Chris
Topic: 1616 Message: 1616

I realise that the new program is called V4 "Chat" because it aims to emulate the chat mode functionality found in internet programs like Skype and many others. But it seems to me in the HF ham radio environment "QSO mode" might be better in many circumstances i.e. conversation is formatted into "overs" rather than short sentences.

Both in ARQ and FEC, V4 use of cntrl<ent> or Queue Data button makes it hard to handle the normal "QSO" situation. For example, in ARQ unless the ISS keeps remembering to hit cntrl<ent> or "queue data" every few words the buffer will empty and the link may turn around unintentionally - because the IRS already has some text waiting in his buffer. And in FEC I think something similar can happen. Transmission keeps halting unless the operator remembers to keep using the cntrl<ent> sequence every few words. And if the other party to the qso has some text - maybe incomplete - already in his buffer then his station may detect "channel clear" and transmit what may be an incomplete chunk of text. Messy!

Both these situations were nicely handled in earlier ARQ modes like Amtor and Pactor 1. Both used the space character ("wordout") at the end of each word to pass the text from the transmit screen to the transmit buffer. And both allowed the operator to decide on ARQ turnaround and FEC transmit via operator entered control codes.

Of course it is likely these issues will be taken care of in future if V4 is incorporated into multi mode software like FLDIGI, MixW and the like. But even right now, in the Beta stage, it would make V4 easier to manage. Even "wordout" on it's own would be a help.

Hi Rick,

I've written some rich text box code over the years and have used the following lines of code after adding text to the box:

```
richTextBox.SelectionLength = 0;
richTextBox.SelectionStart = richTextBox.Text.Length; //set selection to end
richTextBox.ScrollToCaret(); // and scroll to that to make sure we can see the last line written
```

You may be way ahead of me on this, but IIRC, this code has worked in the past.

Just to make sure, I just retested the code. It seems to properly space the last line above the bottom of the rich text box. BTW, this is C# code using Visual Studio 2010.

Rick

The TS-590S does indeed have a built-in sound card, and it works very
well. PTT is achieved by VOX over the USB connection.

Go to this page:

http://homepage.ntlworld.com/wadei/ts-590s.htm

and follow the link:

"HOWTO set up the Kenwood TS-590S for Digital Data and Digital Voice
Operation "

Also on this page you will see links to all the TS-590S manuals.

Hi Finn,

I have the TS590 and use the built-in USB sound card. Cat is used for the PTT. The setting in V4 is Kenwood TS480AUX. My T>R is 31 msecs.

The Cat control setup can be downloaded from Kenwood site.

It's a very neat setup with just one cable between rig and PC.

Successful QSO yesterday with OH7TE/Yussi in Lapland. Heard a number of weak W stations on 20m around 2100Z. Tried a few calls without much success. Hopefully when condx improve we will manage some more W/EI QSO's on V4.

1624. Re: [V4Protocol] CHAT MODE VERSUS QSO MODE

Yahoo group: V4Protocol
Date: 2011-08-11 10:37:11 UTC
From: Rick Muething
Topic: 1616 Message: 1624

Chris,

Those are all reasonable observations. Lets separate two things:
1) The V4 protocol. It's a bit level protocol FEC or ARQ that moves bits (error free in the case of ARQ). That is completely independent of the GUI or mode in which it is used. That is one reason the V4TNC is kept separate and could be used by any other application supplying the GUI.

2) The V4Chat Functionality and GUI. This is a shell to interface the user to the V4TNC. It has no real knowledge of the protocol details it only works via simple messages (via local TCP) to/from the TNC. This is the program that controls how data is entered, displayed, radio is controlled, spell checked etc etc.

Most of the work to date (in terms of my effort and hours) has been on the protocol itself and the V4TNC. Without that working reliably there is no need for any GUI like V4Chat.

Now there are an infinite number of ways to handle the exchange, turnover, data entry and display and I am sure that no two people would agree on what is best in that respect. It's a personal thing. Lets take for example using the "word out" mechanism for transferring typed messages to the buffer. Yes it is more convenient since you never need to type Ctrl + CR but also you cannot go back and edit data except within the current word. That is a big restriction. Now I could put a switch that allows going both ways or even a switch that allows sending in one of 6 ways but that adds more complexity to the GUI program and what the user has to learn. (There are a still lot of people that still have trouble grasping the concept of ARQ and ISS or IRS states!)

I could also force users to use an OVER command or BREAK command within the GUI and protocol to switch ISS and IRS. There are some implications of that that do flow down into the protocol level but they can be handled. But those also add functional complexity. E.g. I am the IRS and I want to break the ISS ...he is still sending data. I can allow that (currently it is blocked) but then what do you do with the data the ISS already has queued? Do you dump it or send it later when you get to be ISS again or allow the ISS to edit it or what? The answers to these questions are not usually obvious and certainly each user will have his preference. Again it is not a question of can you do these things...certainly the GUI and even the protocol can be adapted but is there good reason that will look and feel right to the general user population.

The thought of using the chat type format was to try and mimic what you might do on a short message system. That is easy enough when you have a full duplex setup but as we know full duplex on HF is generally not possible so we have to adapt to a half duplex environment.

I am open to all suggestions but from experience I know that in this GUI area it is pretty much impossible to please everyone. And while it is possible to tailor the GUI (user options) when those users communicate there has to be some consistency in how things like half duplex are handled or there will be total chaos.

As I feel the protocol itself becomes more stable (e.g. that last rev made minor changes in the sync coding mechanism that improve its reliability in poor channel conditions...but it also made it incompatible with all prior versions) I will be able to spend more time on the GUI stuff. I also need to document well into a Programmers package how to interface to the V4TNC to encourage other developers to be able to incorporate the V4TNC and add their own GUI, Mail/message system etc. I know there are a lot of guys out there that can do the GUI (probably much better than I) but I also know there are only a handful that know how to write HF ARQ sound card protocols. This is the way I did the WINMOR protocol and now it is used by about half a dozen (that I know of) applications.

Your comments and feed back welcome.

Robert,

Thanks.

Yes that is basically what I am doing (but added buffering to hold incoming data while scrolled). The problem is in the actual rich text box. The ScrollToCaret does scroll down but the line is not always visible when you allow the size of the rich text box to be adjusted via something like the horizontal splitter (it has to do with the size of the box and the size of the font).

I have poked around on the web and this is a common problem reported. What I think might be the simplest solution is to simply add a temporary new line (CrLf) at the end before issuing the ScrollToCaret. And then when new text arrives simply remove that ending CrLf, append the new text, add back the temp CrLf and ScrollToCaret. That dummy new line should keep the text always visible. I'll play with that today.

Rick KN6KB

```

You may be way ahead of me on this, but IIRC, this code has worked in the past.

Just to make sure, I just retested the code. It seems to properly space the last line above the bottom of the rich text box. BTW, this is C# code using Visual Studio 2010.

will work on long term solution for this (it messy) but in the mean time you can (I confirmed this on several computers) find an adjustment of the Session text box height (by dragging the horizontal splitter) such that at least most of the last line of the session box is visible as it arrives.

Ian,

Thanks. A good reference. It seems pretty similar to the Icom 7200 but the Icom requires a PTT on/off command (it is just one of the control or CAT commands that go over the virtual com port of the USB). I suspect the TS-590 also has a PTT on/off command (other Kenwood radios like the TS-480 and TS-2000 do).

One thing is for sure: A single USB cable connection for Control and audio(via the built in sound card) is sure the easiest way to hook up radios like the TS-590, IC 7200 and IC 7600. I suspect we'll see this becoming standard on virtually all new HF radios (the codec chip and USB interface are dirt cheap compared to the radio!)

From: George Murphy
Topic: 1628 Message: 1628

Rick,

This is a brief message to let you know that your new V4 Chat, Version 0.5.0 0 appears to be working AOK at this QTH! A few minutes ago I completed a 15 minutes ARQ Mode qso with K1DOW (Russ) in Arcadia, FL. Russ is located 1223 4 miles from my "shack" here in Southern New Hampshire per the QRZ.com database. I am running 20 watts into a 7 el yagi up 55 feet. My O/S is Windows XP Professional. We experienced "no dropouts or disconnects" during the entire qso. Russ's R/S was about 5/8 with me w/ a slight bit of QSB. However, the band condx between us did not degrade the 100% reliable contact we experienced via the referenced band and frequency. My " Measured T>R Latency Reading" remained close to 67ms during the entire QSO. K1DOW and I switched to V4 Chat's "FEC Mode" briefly at the conclusion of our successful ARQ Mode contact. The text data we shared between our two (2) stations using the FEC Mode was also 100% reliable and no errors were recorded on this end of the QSO.

In closing, I hope this brief bit of feedback in useful to you and other hams using your new Version 5.0 release. On behalf of the worldwide community of ham radio operators, thanks for devoting your time, talent and programming skills to bringing these new and exciting digital modes to us. We certainly appreciate all that you have done and continue to do via the development of these wonderful digital communication modes for the best hobby in the world - Ham Radio! Good luck and we wish you continued success

73,
George A. Murphy, K3RQ
Milford, New Hampshire

Good idea Rick. The temporary new line should work well enough. I wonder why I don't have the problem with my test code. I have not used a splitter, so that may be the difference. I too will have to poke around a bit more.

> Yes that is basically what I am doing (but added buffering to hold incoming data while scrolled). The problem is in the actual rich text box. The ScrollToCaret does scroll down but the line is not always visible when you allow the size of the rich text box to be adjusted via something like the horizontal splitter (it has to do with the size of the box and the size of the font).
>
> I have poked around on the web and this is a common problem reported. What I think might be the simplest solution is to simply add a temporary new line (CrLf) at the end before issuing the ScrollToCaret. And then when new text arrives simply remove that ending CrLf, append the new text, add back the temp CrLf and ScrollToCaret. That dummy new line should keep the text always visible. Iâ☐☐ll play with that today.

1633. DISAPPEARING TNC screen

Yahoo group: V4Protocol
Date: 2011-08-12 01:40:41 UTC
From: Hoby KK8G
Topic: 1633 Message: 1633

While John, KJ1J, and I were in session on FEC (couldn't maintain contact on ARQ) I must have hit some key stroke, the TX and RX boxes stretched out to the entire screen height. I lost the TNC box. I could click on the minimized box for the TNC and see it, but when I typed the next letter, it would again disappear. (It was hidden under the Chat screen, but couldn't get it back on top.)
Like to know what I did, and how to correct it when I do it next time. With my fat fingers, I'm sure I'll do it..

Hi Finn

You can certainly use the USB connection for CAT control, but I am not sure if you can transmit (digitized) audio tones over the USB connection *and* send CAT commands over the same USB connection at the same time. I have only tried VOX PTT over USB. Maybe somebody could expand on this?

However, the TS590-S also has a serial port that you can use for CAT, in which case you could definitely use that port for CAT PTT and the USB for audio.

1644. Re: CHAT MODE VERSUS QSO MODE

Yahoo group: V4Protocol
Date: 2011-08-13 04:22:59 UTC
From: wb6yte
Topic: 1616 Message: 1644

Thanks for the explanation, Rick. I look forward to your development of the physical layer protocol. I think a <= 200Hz wide ARQ mode with automatic mode negotiation will become a very popular addition to the digital modes.

The chat mode had me confused until this explanation. The main problems I have had with it are the requirement to press <ctrl-enter> to transfer the text to the TX window and the 'dead air' idle time after the BTU while the other station is typing a response. I understand the chat client is just a tool for testing the OTA protocol but I was wondering if it would be helpful to do the text transfer with just a <enter> like the common internet chat clients?

Are there any free chat clients available that could be adapted for this so you could keep your focus on the modulation and ARQ protocols? What about the possibility of using just a simple terminal program?

I agree with Chris that the QSO mode might be worth trying. It might make the operation a little smoother for us since we are all more accustomed to that style of operation.

Your documentation says that the transmission is framed in 16 character blocks. Do you plan to implement variable block sizes in the future?

Thanks for your good work.

>
> 2) The V4Chat Functionality and GUI. This is a shell to interface the user to the V4TNC. It has no real knowledge of the protocol details it only works via simple messages (via local TCP) to/from the TNC. This is the program that controls how data is entered, displayed, radio is controlled, spell checked etc etc.
>
> Most of the work to date (in terms of my effort and hours) has been on the protocol itself and the V4TNC. Without that working reliably there is no need for any GUI like V4Chat.
>
> Now there are an infinite number of ways to handle the exchange, turnover, data entry and display and I am sure that no two people would agree on what is best in that respect. Itâ□□s a personal thing. Lets take for example using the â□□word outâ□□ mechanism for transferring typed messages to the buffer. Yes it is more convenient since you never need to type Ctrl + CR but also you cannot go back and edit data except within the current word. That is a big

restriction. Now I could put a switch that allows going both ways or even a switch that allows sending in one of 6 ways but that adds more complexity to the GUI program and what the user has to learn. (There are a still lot of people that still have trouble grasping the concept of ARQ and ISS or IRS states!)
>
> I could also force users to use an OVER command or BREAK command within the GUI and protocol to switch ISS and IRS. There are some implications of that that do flow down into the protocol level but they can be handled. But those also add functional complexity. E.g. I am the IRS and I want to break the ISS ...he is still sending data. I can allow that (currently it is blocked) but then what do you do with the data the ISS already has queued? Do you dump it or send it later when you get to be ISS again or allow the ISS to edit it or what? The answers to these questions are not usually obvious and certainly each user will have his preference. Again it is not a question of can you do these things...certainly the GUI and even the protocol can be adapted but is there good reason that will look and feel right to the general user population.
>
> The thought of using the chat type format was to try and mimic what you might do on a short message system. That is easy enough when you have a full duplex setup but as we know full duplex on HF is generally not possible so we have to adapt to a half duplex environment.
>
> I am open to all suggestions but from experience I know that in this GUI area it is pretty much impossible to please everyone. And while it is possible to tailor the GUI (user options) when those users communicate there has to be some consistency in how things like half duplex are handled or there will be total chaos.
>
> As I feel the protocol itself becomes more stable (e.g. that last rev made minor changes in the sync coding mechanism that improve its reliability in poor channel conditions...but it also made it incompatible with all prior versions) I will be able to spend more time on the GUI stuff. I also need to document well into a Programmers package how to interface to the V4TNC to encourage other developers to be able to incorporate the V4TNC and add their own GUI, Mail/message system etc. I know there are a lot of guys out there that can do the GUI (probably much better than I) but I also know there are only a handful that know how to write HF ARQ sound card protocols. This is the way I did the WINMOR protocol and now it is used by about half a dozen (that I know of) applications.

From: Rick Muething
Topic: 1616 Message: 1645

Ed,

The problem as I mentioned in that last reply is that this is half duplex. (Pretty hard to send and receive on the same frequency at the same time on HF!). So you always in any half duplex ARQ Protocol (AMTOR, PACTOR 1,2,3, WINMOR, V4 etc) have a lag where the receiving station (IRS) must wait for the sending station (ISS) to complete and then transfer the link. There are a few ways to do this with OVER and BREAK commands but V4Chat currently does it automatically when the buffer runs “dry” and the other side has something to say (“buffer > 0”) . It is not a questions of “finding a free chat client” available...it is one of working through the logic of how do you send text and reliably exchange IRS<>ISS in a half duplex channel. I think if you sit down and work through the details of that you may get a better understanding of why it works like it does.

Sending the text to the buffer on "Enter” is a trivial change ....but it also doesn’t allow you to edit anything after you have hit the Enter. In fact my original version of V4Chat used that and most agreed it wasn’t the best way. Again one has to think through the logic of when do I want to COMMIT this text for transmission and when do I want to still be able to edit it.

Variable size blocks are possible but always a tradeoff:
1) Short blocks are very inefficient. For each block transmission you have two leaders (IRS and ISS), two syncs, two holdoff times for latency (currently 300 ms each), one CRC byte and 6 Viterbi flush symbols....that is ALL overhead to actually sending the 16 characters of data. So the gain is not linear at all (e.g. half the size will end up with something like 25% less throughput)

2) You have to add sync types for each block size desired....the program has to know for how many symbols to look for the data (remember its very noisy most of the time). So you would need a different sync for 16 chararacters, 8 characters, 32 characters etc). You can’t reliably put the block size in the beginning of the data....what if you can’t decode the data?

3) Longer blocks are more efficient but also have more latency....You have to wait more and that is not well tolerated in a chat back and forth type of QSO. It is more efficient for sending large files or messages so is used in WINMOR for example where the frame time is about 2x V4’s 3 seconds.

I am open for any and all suggestions but it is important to really think them out to make sure they are solid logic and don’t compromise functions that are also necessary.

73,
Rick KN6KB

Your documentation says that the transmission is framed in 16 character blocks. Do you plan to implement variable block sizes in the future?

Thanks for your good work.

Topic: 1616 Message: 1651

Rick and all,

In the recent "half duplex" paragraph Rick said "(Pretty hard to send and receive on the same frequency at the same time on HF!)."

Agreed.

It's been a while since I've used it, but you may want to take an hour or so and take a look at ALE400 mode in MultiPSK. After you wade through the user interface, if you can find another ALE400 user (make a sked on the K3UK pages, or perhaps use two back to back computers to test) you'll find your chat data flowing both ways almost simultaneously, at least in slow human terms. So much so, in fact that it can be a bit disconcerting when you ARE thinking in the half duplex paradigm. It almost seems like carrying on a conversational QSO in old AX.25 packet.

I'm not making a judgement here on the merits of half vs. a pseudo full duplex. Just pointing out a possible design consideration.

From: wb6yte
Topic: 1616 Message: 1653

Thanks for the response, Rick.

I understand that the physical channel is half duplex but I don't quite understand how that prevents the appearance of full duplex operation to the user. I was also thinking of the ALE400 implementation in MultiPSK and the old AX.25 packet operation. I tried ALE400 a couple times recently and it seemed to have the feel of full duplex. The user did not have to initiate the transfer of text to the TX buffer. All text was available for transmission as it was typed. Of course the text had to be packaged into blocks to be sent. As with other digital modes, the text can be edited any time before it is actually sent.

For experimentation purposes how difficult would it be to implement user configurable options for handling the operation? The IRS<>ISS switching logic sounds fine but it may be interesting to experiment with different options for transferring text to the TX buffer.
1) Require the operator to terminate text with <ctrl-enter> or <enter> to move it to the TX buffer.
2) Transfer text (in blocks) as it is entered.

Again, I don't want to distract you from the work on the core protocol.

John,

I use Patrick's ALE 400 in his MultiPSK program now and then to chat with my friend Mike, K9MI on 20 meters. It is everything you say it is. Just type what you want to say and it goes right out, seemingly interlaced with receiving the text sent from the other station you are connected to. It's the closest thing to operating AX25 packet that I have ever used (data flow wise) and makes for a very natural one on one conversation. The robustness under marginal on the air conditions is amazing as well. Seems this mode has been a well kept secret. ;-)

GM Dick,

We sort of made it on V4 last night. I think conditions were more suitable for Olivia than V4 or HRI.

I think I got most of what you said but for some reason apparently you were not copying me as well, OR, I was not copying your confirmation chirp for some reason. I didn't quite understand what was going on. I would send a transmission, hear you chirp back and then it would try to resend the same thing again. The cycle repeated over and over again. I knew it kept repeating the same info as the queue length never changed.

I saw the same thing occur on another QSO earlier in the day. I was just monitoring that QSO. Things were going along and then one station just started repeating the same info over and over again. Something must get broke inside the program. It seems to work for a while and then breaks.

Let know when you get that extra memory.

1667. V4Chat Update 0.5.1.0 Full Install uploaded to Yahoo FTP

Yahoo group: V4Protocol
Date: 2011-08-18 19:54:03 UTC
From: kn6kb
Topic: 1667 Message: 1667

All,
After getting a Flex setup I was able to do extensive testing (RF over the air) with V4 Chat and the Flex 3000 SDR. Several changes had to be made to improve operation with the Flex. This new release alson include new updated help with detailed instructions (follow closely!) on setting up the Flex SDR radios for V4. Feedback from Flex users welcome.

Also included are GUI options (in the V4Chat setup menu) that allows three options for controlling when typed text is sent to the Outbound Queue. It will default to the prior mode of operation but you can then change to send on CR or Send on double space.

As usual this will require an uninstall and reinstall...Perhaps auto update will be turned on for the next one! No settings will be lost.

Rick KN6KB

V4 Chat Revision History

Date: Rev Change Summary

Aug 18, 2011 0.5.1.0 Beta release of 0.5.0.1

Aug 15, 2011 0.5.0.1 Added options on setup for Send command to be Ctrl+CR, CR, or CR or Double Space.
Update Help to include Flex SDR Setup info.

V4 TNC Revision History

Date Rev # Summary ofChanges

Aug 18, 2011 0.5.1.0 Beta release of 0.5.0.1

Aug 18, 2011 0.5.0.1 Rework of PlaySoundStream to always clear blnStartWaveSteamAfterDely. Also always test output
of PlaySoundStream and log exception if failure with indication of where called.
Modify Calculation of T>RLatency to use only average of one symbol on Capture with threshold of 2 x transmit.
Modify ComputeSN to return a max of 100.
Add 6 blank symbols (128 ms) on tail of transmitted wave to accomodate Flex Radio required "flush"
Change caluclation of avg S/N in dB (experimental)

Rick,

When I read the notice about 0.5.1.0 I thought it was only an improvement for the Flex folks. But it looks like it's improved my operation on the Kenwood TS-590. I had quite a long QSO with K3GAU tonight and only toward the very end when the band was going did it loose sync and one station transmitting on top of the other station even though the signal sounded strong. Quite an improvement.

Thanks,

Ron ny3j

Based on my initial testing, the protocol's coded state machine now seems very robust. Error recovery seems to work even with deep qsb and signals fading way into the noise.

Rick: How about the ability to export the log to ADIF?

OR has someone already written a macro to convert the V4 log to ADIF format?

Way to go Rick! We have a real winner here.

Rick:

For the ADIF specification, have a look at

http://www.adif.org/

The Mode Enumeration field is going to be the tricky part since presently, V4 is not part of the ADIF specification. The closes mode type would probably be MFSK8. I would leave the mode type be a configuration option.

An example from the JT65-HF log would be a good place to start:
<CALL:4>K9QV
<BAND:3>20m
<FREQ:6>14.076
<GRIDSQUARE:4>EN60
<RST_RCVD:3>599
<RST_SENT:3>599
<QSO_DATE:8>20110818
<TIME_ON:4>1747
<TIME_OFF:4>1751
<TX_PWR:2>50

Globally configured
<MODE:5>MFSK8 ??
<STATION_CALLSIGN:6>VE3FWF
<MY_GRIDSQUARE:6>FN25bh

The above fields should be quite adequate

All,

I have 5.1 up and running with my Icom 7000 but not yet on my Flex 1500. Is there a doc around that addresses setup of V4 with Flex radio's?

With the Icom radio I have done some testing with ZL1FZ (14073 USB dial) over a poor groundwave path but no DX contacts as yet. I have logged a CQ from AE6LA but was out at the time!

The new space space option is great!

Another question: How long before an ARQ link times out if both ISS and RSS have empty outgoing buffers?

I am monitoring 14073 most of the time. VK's and other ZL's - where are you guys?

Chris,

As they say...when all else fails read the help! I spent 2 days documenting the setup for the Flex 3000. The 1500 should be virtually the same. Open up the Help, look in the index and find the section on using the Flex Radio.

Chris,

Re ARQ timeout:
Each station has a timeout value setting (30- 180 seconds ...I would recommend using 90-120 seconds). What that means is very simple. If EITHER station doesn't see any data flow (ACKs and IDLs don't count as data...Data followed by ACK is counted by both sides as data flowing) in their timeout value the station will end the link. Once data flowing is seen the timer starts all over again. You have to have such a mechanism for any ARQ system or the two would sit and chirp IDL's and ACKs back and forth forever. Pactor and WINMOR have similar timeout mechanisms.

Many thanks Rick! I have now reset my ARQ timeout from 30S to 120S. This should take care of sometimes premature link down situations seen during testing yesterday with my buddy Clive ZL1FZ.

And now, after having read the V4 Flex Help section (ahem!) I have my Flex 1500 up and running. It only took a coupe of minutes. I see 2 watts RF out on the little Flex 1500 barefoot but next step is to use my 100W linear. I expect 2 watts will drive it to around 30 30 watts which is what I normally use with FLDigi on other digimodes.

No QSO's yet but I hope I can run some on air tests later today.

Rick, sincere thanks for all your help and patience.

73 to all, Chris

From: ka1gmn
Topic: 1682 Message: 1682

When calling CQ or calling a specific station, the latency test results are not displayed.

Setup:

V4 Chat v0.5.1.0

Flex - 5000A

PowerSDR v2.1.5.26706

VAC v4.9.0.1652

VsprMgr 1.0.3.01

Windows Ultimate 7 w/ Service Pack 1

Set up the VAC and PowerSDR settings as describe in the V4 Chat help files that specifically addresses the Flex-Radio/PowerSDR.

If there are Flex users out there that have gotten the latency test results to display, I would be very interested in how you made it work.

Thanks,

Phil de ka1gmn

1683. Re: [V4Protocol] No latency results with V4 Chat V 0.5.1.0 - PowerSDR v2.1.5 - Flex 5000A

Yahoo group: V4Protocol

From: Rick Muething
Topic: 1682 Message: 1683

Phil,

It is essential that you have sufficient receive “noise” to drive the receive level indicator on V4 well into the green area. It is the return of this “noise” after PTT is released (PTT blocks receiver output noise) that is used to tell when the receiver is again “alive”. The latency measurement is just the delay from PTT release until receive noise breaks the noise threshold which is 2 x the average “noise” observed during transmit. You can’t have monitor on of course to make this measurement since then there would be no “blocking” of audio by the PTT.

Also you want to be sure to set AGC to fast and MON is off.

I have done this in my extensive testing using a Flex 3000 on several bands which generally very consistent results (Latency measurements usually within 20-80 ms of each other). There naturally is some variation due to OS issues, timers, etc. As long as the latency is below or at least near 250 ms it is fine. (over 300 ms will cause problems).

From: Ted Leonard
Topic: 1684 Message: 1684

I have set up my Flex 3000 per Ricks instruction and mostly get strike thru when monitoring on the constellation it is usually a shotgun pattern all over but now and again I see neatly organized patterns in the 4 corners of the constellation and will get perfect decode such as the one I saw about 5 Min ago in the CQ from KB0E ---a perfect decode several times (I forgot to count them) like 5 in a row. Sadly most of the time I see only the shotgun pattern filling the whole constellation.

My T/R latency is between 148 and 168.

I have set up my Flex 3000 per Ricks instruction and mostly get strike
thru when monitoring on the constellation it is usually a shotgun
pattern all over but now and again I see neatly organized
patterns in the 4 corners of the constellation and will get perfect
decode such as the one I saw
about 5 Min ago in the CQ from KB0E ---a perfect decode several times (I
forgot to count them)
like 5 in a row. Sadly most of the time I see only the shotgun pattern
filling the whole constellation.

My T/R latency is between 148 and 168.

Ted,

I should have been more specific. Increase the squelch level in the V4 TNC
not the squelch on your radio. My noise level ranges from S3 to S9 depending
on day and time of day. I advance the squelch until the constellation goes black
with minimal to no strike-thru's.

Ted,

Increase your squelch level. I have mine at 5 and
see very few strike-thrus. It will depend on your noise level.

Hi Fred,
Thank you for the tip on squelch, it made quite a difference in the rate
of strike through.
Much more solid decode, now I can read up on using the mode and maybe
try a QSO later.
Again thank you.

Average latency is now 180 mS.

Followed Rick's advice below.

Adjust graphics driver for maximum performance.

Set power management to maximum performance.

Diabled Macafee - real time scan, and firewall.

Follow the setting for the PowerSDR in the V4 Chat section for the
Flex-Radio line.

Only running Panadapter on PowerSDR.

Disabled virtual memory do eliminate PageFaults.

So, far I've had two sucessful QSOs - a first.

Ted/All,

The squelch has minimal effect on ARQ mode as there should never be any “strikethrough” in ARQ. Generally squelch ranges of 3-7 should be all that is ever needed and 5 should work most of the time in ARQ mode.

Rick,

If I am just monitoring a frequency, even in ARQ mode, the squelch adjustment makes a big difference.

But that's the least of my problems. My FT920 just died on me. I'll have to open it up and see if I can
find a problem. But that's for another day.

Fred,
Well the ARQ mode works EXACTLY the same as the FEC mode when you are NOT connected. But when you are connected you won't get any text with strikethroughs. If you put the threshold too high you will miss syncs on very weak signals. If you put it too low you will always be tripping on non existent syncs and may miss real ones.

Good luck on your radio...that comes first of course!

I think that is what Ted was referring to. Not connected, just monitoring.

When I get time I'll open the radio and check it out. One of the problems I've read about in the FT920 group is oxidization of connectors especially under humid conditions. I've had the rig for about 10 years and its served me well.

Yes Fred, I was just trying to get a handle on why so much strike through was happening as
I monitored and tightening the squelch helped a lot and I guess I see what Rick said if
actually connected in ARQ you wouldn't see all the strike through.
Just trying to get my feet wet a little at a time so as not to trash the band.

Hope you get your FT920 working.

Bernie,

Thanks for the advice. I don't usually run the noise reduction, but I will keep that in mind.

In the case of the PowerSDR, I turn off the pan display completely. Kind of a radical step, but it dropped the average CPU load down 15%. This tells me that the graphics driver/hardware is a contributor to the over all load on the PC.

I would not want to be without the pan display all the time, but in the case of running V4 Chat, it may be worth while to give up.

I am averaging around 175 mS latency at this point and have made two success QSOs.

Hello phil
My findings for lowering cpu power where nearly the same ...
But in a different software :-)
I use hdsdr with my sdr radios (only receive) ... and if cpu load is high I just turn down the speed setting and resolution on the waterfall ... just lower count of graphical points for the cpu to calculate ...
I can not switch it off but lowering the speed helped a lot ...
See if in power sdr the same could be done ... so you could lower cpu load and still have the pan display maybe ?!?!?

GM Fred,

Don't know what kind of connectors are used on the FT-920 boards, but if can get to the fingers or pins run a Pink Pearl erasure across them several times. I was told this trick by several service folks and have done it myself. The erasure is just abrasive enough to take the oxide off without damaging the plating on the pins or fingers. :-)

Hi Rick,

Just a thought. Would it be worthwhile to ignore the squelch level if you are connected and enable if not connected ??

Fred, W1WYC

Fred,
Well the ARQ mode works EXACTLY the same as the FEC mode when you are NOT connected. But when you are connected you won’t get any text with strikethroughs. If you put the threshold too high you will miss syncs on very weak signals. If you put it too low you will always be tripping on non existent syncs and may miss real ones.

Good luck on your radio...that comes first of course!

It's not a good idea to clean modern edge connectors with an eraser.
This was a standard technique in the "old days" when the plating was
thicker on the connectors and can cause permanent damage to the newer
connector contacts. I recommend a good contact cleaner such as DeoxIT.
This not only cleans the contacts, but also protects against future
corrosion.

Hopefully contact cleaner has evolved. 20 years ago many types of cleaner was tested but none could beat the pink pearl.

1706. New V4Chat Update 0.5.2.0 on Yahoo FTP

Yahoo group: V4Protocol
Date: 2011-08-23 01:47:41 UTC
From: kn6kb
Topic: 1706 Message: 1706

All,

This rev contains several important fixes of problems that were the cause of some reported hangups. It also contains new code suggested as a way to solve the waterfall or constellation "freeze" problem. Unfortunately since I don't see that problem on my computers (believed to be a function of which Video chip set/driver you have) I can't confirm that for certain. This new code will also reduce CPU and graphics loading due to the constellation replot which should help on slow computers or computers running Flex Radios.

If you encounter a Waterfall or Constellation freeze please check the exception logs. If there are exception log errors please forward them to me (as attachments) along with your V4 debug log and when (UTC) the freeze problem was observed. It is a big help if you can identify this time to then nearest few seconds.

Unless there is a major problem with this version this will probably be the last update while we make preparations for Hurricane IRENE and a trip we have scheduled next week.

As usual you will have to uninstall the old version prior to installing this one (hopefully I'll have Autoupdate in for the next rev).

Rick KN6KB

1707. Noise and functionality

Yahoo group: V4Protocol
Date: 2011-08-23 11:22:24 UTC
From: ka5s
Topic: 1682 Message: 1707

Some four decades ago (and a few years) I had a devil of a time with a certain UHF aircraft radio; they kept coming back for "unable to adjust squelch." Turned out, there wasn't enough receiver noise with new RF preamp tubes to let the pilot unsquelch the thing with his control panel during pre-flight. Ended up hand selecting noisy RF amps to get past that problem.

Why do I mention this? You see it coming: IMO(!) relying on noisy equipment or band conditions to make a system work is not a good idea. What if a band is quiet?

Cortland KA5S

Cortland,

This is not a question of squelch in the conventional way it is used in VHF/UHF radio.

Let me explain the process a bit more.

First the Measurement of latency has no bearing on if V4 works or not...it is simply a tool added to allow users to get a handle (at least a rough measurement) of the latency. The number measured is simply displayed...it is not used for anything but is to notify the user they may have some problem (most commonly the VOX or DLY setting on the transceiver or SignaLink set above minimum....something the software has no control over).

Second think about the problem of measuring latency a bit. When you key the transceiver the PTT blanks or mutes the receiver audio. So you have virtually 0 audio coming from the receiver. Now you release the PTT. When do you know the receiver is again active?....(that the latency time has elapsed...) The only thing you have to look at is the background noise from the receiver and on HF this is never 0. In fact as long as you have AGC on (not masked off with the RF gain control) the background noise audio level will be close to the normal received audio level (that is what AGC does!).

If someone were to ask you to measure this latency on a HF receiver how would you do it? Maybe use a dual trace scope with one trace showing the PTT and the other looking at the audio out of the receiver... This is exactly the same thing the software is doing.

So using the receiver audio level of the background noise is the only convenient vehicle you have to measure latency with the DSP software. In practice IF you have AGC on and IF you have your audio level set correctly (say about 1/2 way or so into the green) it will ALWAYS measure the latency. At any rate it is a convenience measurement and has nothing to do with the operation of V4.

73,

Rick KN6KB

Rick

Please pardon me for saying so, but is this the right way to do it? You
cannot rely on there being sufficient receiver/band noise to do anything
-- the overall noise level may so low, that the timer fails to trigger.

Surely the way to do it would be something like:

1. At the end of sending a block of data, switch from transmit to
receive and start the round-trip timer.

2. Listen for a recognizable character/block from the other station,
then stop the timer. The RTT can then be computed.

Or is this too simple?

1710. FLex Radio Latency and V4 v 5.2.0

Yahoo group: V4Protocol
Date: 2011-08-23 14:19:11 UTC
From: rapidan2011
Topic: 1710 Message: 1710

I run the Flex 3000 and with the settings listed in the V4 Help except the Xmit buffer is 1024 not 512 as shown. 1024 give me signal distortion.

I have noted that the latency in V4 v5.2, as well as v5.1, jumped all over the place when I switched bands. The latency would be in excess of 300 until I simply turned OFF the Flex then back ON. The latency would then settle in at about 160.

Now the Flex SDR software version is currently 2.1.5. When trying to figure why the latency was so high as described above I noted that the Flex display would freeze and stop working. This happened several times.

I then reinstalled the older, very stable, SDR v 2.0.22 into the Flex and the whole issue went away. The latency is about 150 or so all the time regardless of band. IMO the Flex software v2.1.5 is a Beta and has bugs as I have had other freeze shut down troubles in SSB use.

Now let's hope for good signal propagation !!

Ted, WB2LOu

Ian,
Believe it or not I understand this pretty well! Measuring the round trip time (which V4 also does in terms of computing and optimizing some of the other timing parameters) does NOT measure the T>R latency. In fact the T>R Latency is not even a component of the round trip time. Think about this not so uncommon scenario:

V4 is set up with a modern Transceiver using a SignaLink USB (which uses VOX keying) and the SignaLink keys the transmitter PTT. The Time for the PTT release (AFTER the end of a wave file playing) is a function of the DLY control on the SignaLink...typically < 20ms to as much as 5 or more seconds.
(For an SDR radio the “DLY” might be a function of sample rate, buffer size, filter complexity, VAC cables used etc)

If the SignaLink is set above the minimal delay the PTT release is slowed and this dramatically increases the T>R latency. But the round trip (the end of DATA from the sending station to the first data from the replying station) is NOT affected by sending stations PTT hold time. If the T>R Latency is too long it will block the reception of all or part of the received data (because the station would still have the PTT active). So excessive T>R Latency essentially makes the receiver “deaf” for a period of time and there is no way the remote station could know how long that “deafness” exists without some complex and time consuming “trial and error” repeated search over several cycles. The easiest and most reliable way is to agree on a maximum permissible T>R Latency value and include that in the spec in the protocol . (This is usually done with virtually all HF ARQ protocols). Then make sure each station complies with that max T>R latency value. Setting a max value is always a compromise but is necessary for compatibility. The longer the max T>R Latency permitted the more T>R>T overhead (timing guard bands) in the protocol but the more compatible the protocol is with all popular hardware. The spec in V4 is 250 ms but the program has some guard band and should work up to 300 ms of T>R Latency. That value is large enough that even SDR Radios (with their increased latency) can operate with proper setup. A typical hardware modern radio may have a T>R Latency of 30-50 ms. So you could lop off perhaps 300-400 ms off the protocol T>R>T cycle (< 10%) if you REQUIRED each station to meet that lower T>R Latency spec....but those with older slower radios or SDR radios would probably be out of luck.

Remember in V4 the T>R latency is not measured every cycle and is not even used in the timing calculations. It is measured and presented to the user during a call to aid him in selecting or configuring his station to meet the maximum permissible latency value. For example in the above scenario with a SignaLink or with a SDR if you called CQ or another station with the DLY control not fully CCW or with the wrong setup on the SDR the V4 program will warn the sender with the measured value and a red warning label on the TNC. We don’t want to go back to the 1980’s where to setup a packet station and network you had to guess/enter/tweak half a dozen timing parameters and do trial and error to see if was compatible with other radios on the network.

I have a flex 3000 here and it works consistently measuring the T>R latency. The only requirements are:
1) You have to have AGC on (that is really good operating practice any way to keep the audio level near constant to the sound card)
2) You have to have the audio drive level sufficiently high (I say mid scale but it still usually works in the “blue”). Again this is part of normal sound card setup...it has to have sufficient audio or you will be essentially working with a 8 or 10 bit sound card instead of 16 bits.
3) You have to have MON off on the Flex setup (otherwise the V4 software can’t compute the “quiet” threshold when the PTT is active).

Thanks Ted. One possible thing I noted was two other things on the flex (2.1.5) affected the latency. One was the filter selected. the other was the AGC fast or slow. In theory it should be possible to keep the T>R Latency constant with any AGC speed (by restoring the AGC level to the value immediately preceding the PTT activation).

What I am trying to do is strike a happy balance by providing a spec guard band on the timing so we don’t have to have each user try and guess/setup a specific level for a QSO yet we don’t bog down the protocol with unnecessary large timing guard bands. We could eliminate the problem of T>R Latency almost entirely by forcing (by program timing) a guard band of say 1000 ms. But this would also about half the ARQ throughput in all cases. Not a good solution.

Hopefully as the folks at Flex Radio get a better understanding of how ARQ modes work and how radio setup affects them we’ll converge on a good balance.

I forgot to mention or add that I have the FLEX AGC set to FAST, the filter BW is 1.5kHz and depending on band noise/conditions, I adjust the FLEX VAC RX Gain to give almost max noise showing on the V4 TNC screen. Also I adjust the Squelch to where the Busy/Clear window is bouncing back and forth.

One more thing is the ALC setting....on the FLEX I adjust the VAC TX Gain to give a -1db to 0db ALC reading on the meter of the FLEX. A setting of 1 db or greater can lead to distortion of the transmitted signal.

These settings are not perfect. The differences in the computer sound cards used for Flex digital operation require experimentation with the settings and I know this is also true for non-FLEX radio users....everyone''s mileage will vary.

I also would like to report good results with a Flex 5000A. I'm showing the latency at 160ms, and have now completed 5 QSO's, one with fairly weak signals both sides of the QSO, both around S-4 with QSB and a good completed QSO on 20 meters. With more activity, I could have had many qso's.

Also, I was one of the guys having a problem with freeze of the program and sent error logs to Rick. This not related to the Flex PowerSDR. With version V4v5.2.0, I now do not have the freeze up problem . Only one QSO check so far with this 5.2 version, but looks good so far with no freeze of the program. .

Rick is doing a fantastic hard job. Thank you.

Robert, All
That last update which used a suggested method of graphics updating inadvertently gobbled up a lot of CPU time maintaining the shadow waterfall graphics. I have an update which I am now testing that put is back to the original CPU loading but I want to test it further to see if it precipitates the waterfall freeze. Unfortunately since I never see the waterfall freeze here on any of my computers testing the release to see if it fixes (or makes worse!) the waterfall freeze is a time consuming and hit or miss effort.

If others have had waterfall freezes that want to try out a test version let me know and I'll send you a test V4 TNC.exe file to try.

I stand (or sit) corrected. And thanks for the explanation. I had noticed that using *WINMOR TNC* I was often unable to produce enough noise to approach the green. That really is off-topic here, though.

Cheers,

Cortland Richmond

From: Rick Muething
Topic: 1682 Message: 1722

Cortland,

Not that off topic. The receive levels of V4 and WINMOR are basically the same and they are NOT set internal to either program. The received levels are set ONLY by
1) The audio level into the sound card from the radio speaker or Aux audio output
2) The gain controls (pot and/or jumper) in the sound card interface (e.g. The SignaLink has both a RX pot and an internal jumper J2)
3) On some sound cards (if the driver for that sound card uses the Windows mixer) the mixer gain control FOR THAT SOUND CARD. See the Help on how to set this using the WIndows Mixer. Note Windows may reset this automatically after some Windows updates (don't ask me why!)

The idea of setting the levels toward the middle of the range is simple. You have a 16 bit Sound card. If you don't use at least half of the input range of the sound card you loose dynamic range. Without getting the level toward the middle you may be working with the equivalent of an 8 or 10 bit sound card. If you overdrive the sound card (into the RED) you will clip some of the waveforms and that causes distortion in the DSP demodulator.

GM Rick,

I don't know if it is my computer or something else but I get very inconsistent numbers for latency in V4. They can vary by as much as a factor of 5 to 1 in just one ARQ CQ sequence. I understand that there would be some variation but not by anywhere near 5 to 1. I am using a TS-2000 with SLUSB sound card and a 2.3 GHz E machine. Oh yes, I have plenty of noise for the program to work with. Background noise at approximately half green line. Any thoughts?

Topic: 1682 Message: 1724

Dave,
I really need to see the numbers. They are in the debug log file. Programming is nothing but details!
5:1 is a big spread but 20 ms and 100 ms is 5:1 and entirely possible. 200ms and 1000 ms would be truly unusual. Make sure your SignaLink DLY is absolute minimum. (CCW) You typically should see a number somewhere like 50-120 ms or so. Actually anything consistently under 250ms is fine (as I have mentioned before this is a rough test mainly to catch the extremes in setting). The program does NOT use the measurement at all ...it simply is there to warn the user of a setup or hardware configuration that could cause a problem due to excess latency. You might also check the AGC setting on the TS-2000. Setting it fast may reduce the latency (I haven't checked that yet but it is affected by AGC speed on some radios)

From: Fred G -w1wyc
Topic: 1717 Message: 1725

Hi Rick,

Yeah, the latest revision, 0.5.2.0, really used a lot of cpu time. I looked at the Task Manager and it was up around 100%. I reloaded 0.5.1.0 and the time
came down to about 65% with only V4 running.

I also checked my latency and its running between 72ms and 96ms.

Pretty good I think....

Fred, W1WYC

BTW, my FT920 is intermittent. I haven't had a chance to get inside it yet, we've been busy getting ready for our granddaughters 30th birthday today.
I'll probably hold off on opening the 920 until after Irene clears here Sunday night.

Subject: Re: [V4Protocol] Checking CPU usage of various programs

Robert, All
That last update which used a suggested method of graphics updating inadvertently gobbled up a lot of CPU time maintaining the shadow waterfall graphics. I have an update which I am now testing that put is back to the original CPU loading but I want to test it further to see if it precipitates the waterfall freeze. Unfortunately since I never see the waterfall freeze here on any of my computers testing the release to see if it fixes (or makes worse!) the waterfall freeze is a time consuming and hit or miss effort.

If others have had waterfall freezes that want to try out a test version let me know and I'll send you a test V4 TNC.exe file to try.

From: Rick Muething
Topic: 1710 Message: 1726

Thanks John,

Your input much appreciated. For those that have tried 0.5.2.0 but experienced excessive CPU loading or waterfall freezes (those two MAY be related) I have a test version I will post on the FTP site. This version of the V4 TNC is 0.5.2.2 and uses a slightly different mechanism for the waterfall and constellation update which reduces CPU loading back to about the same as version 0.5.1.0. It also completely eliminates graphic updates when minimized.

For those with a problem with either the CPU loading (generally anything more than 40-50% is too much) or with a waterfall “freeze” please download and try this patch version 0.5.2.2. Simply download the zip file, unzip and replace you current V4 TNC.exe file with the contents of the zip. DO NOT uninstall the current version. You might want to make a back up copy of the current V4 TNC.exe but I am pretty confident 0.5.2.2 will work.

I am working on a new update that will include optional auto updating.

Rick:

Version 0.5.2.2 now only using about 20% CPU on my system. Previous version was using about 40% - no issue for me but someone with an older CPU might have had some issues. No protcol issues based on 2 QSOs today.

From: Rick Muething
Topic: 43 Message: 1729

Thanks Bernie,
That is similar to what I have observed here too. Now if it just helps those with the waterfall “Freeze” issues (I don’t have those either!). I suspect that part of the observed “freeze” problems is the CPU and/or graphics card running out of steam trying to process the waterfall. Minimizing the V4 TNC reduces the loading by bypassing the graphics calculations and display.

Hi Yufenau,

I suugest we stay on 14073. You need a 'watering hole' for the mode.

You can always QSY to another QRG if you have QRM.

In my QTH (Dublin, Ireland) 14073 is quiet for most of the day.

Occasional Hell activity, but only for short periods.

Look forward to another QSO soon.

1737. V4 Chat ver. 0.5.2.2 performing great

Yahoo group: V4Protocol
Date: 2011-09-01 00:18:44 UTC
From: John Sweeney
Topic: 1737 Message: 1737

Been having great chat QSO's on V4 mode with a Flex 5000. The program now operates fine with the Flex with no freeze ups of V4. Showing latency reading of 160ms, well within operating specs for V4. having some very solid qso's, even with weaker signals. Even some DX QSO's longer chats. Total CPU use percent less than 20%.

I also operated V4 with a Ten Tec Jupiter and SignaLink USB interface with good success. The Ten Tec shows latency at 10 to 20ms. I knew the Ten Tec would be fast, was not so sure about the Signalink, but a SignaLink USB is fine on V4 Chat mode.

Rick, looking good.

Those using a number of digital modes snuggle up close to the 14.070 psk31 frequency. Part of that strategy is hoping that they can pull psk31 stations to their preferred mode. For a new mode like V4chat with its yahoo chat group this strategy is not necessary. I would suggest moving above the WSJT favored frequency of 14.073 to about 14.075. When there is rare dx and during contests, the rtty region of the band is quite busy. But most of the time it is not.

We could call CQ using FEC mode. This way we could send more information in the CQ like "CQ CQ CQ ARQ mode de NY3J NY3J NY3J in Pennsylvania at 1500 UTC". Then switch to ARQ mode while waiting for a reply.

Hi Rick,

Also, when I got home last night, N0LWF was logged at 8:51 UTC with CQ call.

Fred, W1WYC - Yes, Like Rick mentioned - and I did look at the LOG file
and noted the UTC times - and I was definitely not around at that time...

Ron ny3j - Yes, that would work, but I was thinking of a system that put it
automatically into the CQ call, from the PC clock. I think Rick is looking
into it...

Robert V31AE - Thanks Robert - 5 UTC is in 4.5 hours (3pm local time) -
so Ill try to be here (Its Fathers Day here) - the system will be in ARQ,
so you can get a link in any case.....Only 14.073 though.

>
>
>Paul,
>
>The CQ timing and all log info is ALWAYS logged in UTC under the main

>
>Rick

I also have some good signals coming from the States on 40, so 7073 around
14:00 UTC - and as I am just getting home from work at that time
(Midnight), I often have a listen.

This Z (Zulu) or UTC seems to be giving grief - The same thing.

'73, and looking for some contacts...

Paul Whitaker.

Paul. I tried ARQ, it connected to your station, but no flow of data...I don't know why exactly but could be just the long delay between us. My change over time here is 10 or 20 ms max..could be just the long distance. Anyway I also put out some data in fec mode. should be all recorded and in your log files..
rst was no reading on the meter but it connected easy...

Hi Robert,
Yes, all copied the connects, and FEC data. Its all on my screen.
Unfortunately, I got home later than I expected, and my Radio/Computer got
to have all the fun !
Sounds excellent with the low sig strengths, so looking forward to seeing
it happen !
I will have a look around later tonight on 7073, and again on 14073
tomorrow at 0500 approx UTC.

And to Ian VK3YEA, county to what has been said elsewhere, this group talks
in DIAL frequencies.

Thanks all,

Paul Whitaker.

Curt,

I had the same thing but I had several programs up in the task bar. When I got rid of these my latency dropped from around 250ms to approx. 65ms.
Certainly made a difference. Windows Task Manager tells all. I look at the Performance window to see the CPU usage.

Fred, W1WYC

Hi all,
Quick report - Had a great contact with AE6LA - Ken, last night about 13:51 to 14:21 UTC on 7073.
Not much signal, but fine copy, repeats only when sig fading.

Working very well.

Monitoring 14073 around 05:00 UTC, and 7073 around 14:00 UTC.
My system is left running most of the day/evening on ARQ, so stations can get a connect even if Im not at the radio.

Cheers

Paul Whitaker.

Same at this end Curt,

I guess it was a bug in the V4CHAT TNC and Rick fixed it. I use a QuadCore PC here and I had latency of 250 mS before v5.2.2. The same was happening with WINMOR TNC and was corrected the same time.

Now with the new version I have a latency of 20-30 mS most of the time. I do not know now if I can believe this latency counter in both V4chat and WINMOR.

Well these are problems that occur when you rely on the PC's soundcard and O/S for the generation of the protocol and not in an external hardware TNC/MODEM/CONTROLLER.
You get what you pay for!

Paul/All,

There is no additional room in the CQ or Connect request for things like Date/time. The frame just now correctly contains both compressed call signs (including – ssid). Plus I don't see any advantage of sending the date/time with the CQ. Any station receiving the CQ or Call already has the UTC time (from the PC Clock adjusted for UTC) and can simply log the time of the decoded CQ or Call sign. In fact as I mentioned this is already done in the log file. Every item on the session screen is logged to the main V4Chat log with the UTC Time/date. I will look into displaying the decode time of the CQ or Call on the session window for convenience. Right now I am trying to get the damn Autoupdate to work correctly!

1757. V4Chat 0.5.3.0 uploaded to Yahoo FTP site

Yahoo group: V4Protocol
Date: 2011-09-05 19:20:01 UTC
From: kn6kb
Topic: 1757 Message: 1757

All,

I am still working on an unresolved issue with auto updates but I wanted to get this interim update posted.

This includes all operational updates to V4Chat and the V4TNC. You will also see now a check box option in V4Chat setup for enabling Auto update (default = enabled). Depending on how the issue is resolved with auto update it still may be necessary to do a full install again on the next release. I need to talk to one of the other Winlink developers to resolve this.

You may also notice slightly different (approx 20 ms longer) latency measurements but this is primarily due to the measurement scheme and some efforts to minimize CPU loading. Any values near 250 ms or less are fine and the program SHOULD work for values up to about 300 ms. I am doing testing on the Flex 3000 and showing latency measurements in the 180 - 230 ms range with the settings suggested in the Help.

You will have to uninstall your existing V4Chat and re install using the new Zip file but no settings should be lost.

There are some changes in this that should reduce some CPU loading which may improve operation on slower computers.

As usual if you have a problem note the UTC time, describe the problem and send me (directly as attachments) the V4TNC Debug log, main V4 Log and any exception logs.

73,

Rick KN6KB Direct email: rmuethingATcfl.rr.com

Date: 2011-09-05 21:01:12 UTC
From: SV1UY
Topic: 1763 Message: 1763

Hi Rick KN6KB,

New version works FB FB FB OM. If you don't mind me asking, there are 2 things missing though.

1. There should be a 3rd window on the right side in the middle. This window should ECHO the text that has been received by the other station.

2. We should be able to have a "selectable/clickable" PSEUDO FULL-DUPLEX QSO, just like in Terminal Programs for PACTOR 1/2/3 QSOS. This way we will be able to fully enjoy V4 chat in ARQ MODE, because we will not need to say BTU OH7TE DE SV1UY PSE K... each time we want to pass the keys to the other party. We will be able just to type away and have a nice V4 chat just like on MSN or SKYPE etc.

I have talked about the above 2 with a few guys and they agree, so if it is not a big thing to do please include them in your V4 TODO list!

Demetre,
Thanks for the feedback. We have talked about a mechanism for showing the text confirmed received by the other side. While a third text window is possible it really gets to be messy. A better and more elegant mechanism is to use change the type font of the sent text (in the session window...now as blue italic) to something like blue-green italic and that would show which text is received. Note too that you already have a running indication of the confirmed delivered text by the outbound queue size. This shows in bytes how much is left for the other side to receive/confirm by ACK. When it goes to 0 everything has been confirmed delivered.

Maybe I don’t understand but the program is already set up for chat and that is just the way I use it for testing. There is no over or BTU command needed.
As the receiving station you can go ahead and type ahead and put data in your outbound buffer. It won’t send until you are the ISS and that won’t happen until the ISS has finished sending all queued data. The if you have data it will switch from IRS to ISS automatically.

The basic rule is simply this:
The ISS stays the ISS UNTIL:
1) He has completed all data (confirmed received by the IRS) and the ISS outbound queue is 0
AND
2) The IRS has typed data and has outbound data to send. The IRS outbound queue is > 0

When those two conditions are met the switchover occurs and should always be safe. There is an interlock mechanism to prevent a failed IRS<>ISS turnover if both IRS and ISS tried to enter data at the same (or near the same) time.

My suggestion of using BTU or some other indicator is just so the other side knows you are really finished typing and not just thinking of more to say with an empty queue. It is not at all required to cause the ISS<>IRS turnover. That is and always has been the idea of V4Chat. Maybe there is a better way to communicate that?

One thing that is important in making these suggestions is to think through and get some feedback on the changes before going ahead. E.g. the third window is probably 2-3 days or so worth of programming and testing and really conveys no more information than what is there now using the outbound queue indicator.

73,

Rick KN6KB

.

Rick et al:

Now that the program is working well, I've been thinking that what would be neat, tho not a priority, would be a graphic indicator of a quality of the link. I'm thinking of something that displays thruput and retries in a simple image of some kind. Of course, with some practice we can tell by observing the t/r sequencing and ACKs but it would be easier if we could tell at a glance how the link is doing with changing conditions.

I'm not a graphics person so I don't have any great concepts in how this should look but a basic bar graph, horizontal or vertical, would suffice.

Just don't use an animated paper clip :)

Thanks.

Pete,

It is hard to measure one or two parameters and show link quality. There is already one very good indicator and that is the constellation display and its score. This shows the “tightness of the symbols” and scores them 0 to 100. 100 is near perfect (4 very small dots in the corners of the constellation plot). A score > 50 is usually decodable without errors. The S/N is also computed and measures the average (across the frame) of the Desired signal (one of the 4FSK tones) compared to the other three tones. Its possible to add more frills, graphs and plots but the goal should be to communicate some useful information not just show and glitz. Its important to remember that the TNC does not actually have to be visible at all...its form is primarily for operator entertainment as there are few controls that are really required.

I’ll consider putting something else in if it makes sense and communicates something of value to the user. There really is not much one can do to improved the decoding other than trying with the filter IN or Out.

Hi Rick again,

After reading your reply and realising that the changes need quiter a bit of programming and since the conctents of the 3rd window I propose are printed in the top window with a different font I will not insist. The program is OK as it is. The only problem I see is the change over mechanism, but then again the IRS station will attempt to seize the link after a full sentence has been typed in the buffer and the other guy has nothing else to send. I noticed this in my QSO with OH7TE yesterday. The only drawback in this is that if the other guy is a fast typist, you will never get the chance to become ISS until the other guy eventually stops typing. When I have a PACTOR QSO every word I type is sent and I can see it echoed back in a 3rd window. My station does not send the whole buffer as a big packet when I hit ENTER.

A better and more elegant mechanism is to use change the type font of the sent text (in the session window...now as blue italic) to something like blue-green italic and that would show which text is received. Note too that you already have a running indication of the confirmed delivered text by the outbound queue size. This shows in bytes how much is left for the other side to receive/confirm by ACK. When it goes to 0 everything has been confirmed delivered.
>
> Maybe I donâ□□t understand but the program is already set up for chat and that is just the way I use it for testing. There is no over or BTU command needed.

Rick. I know a ham friend beeing "colour blind" seeing only grey scales. Maybe text one direction could be bold or underlined or something? if not in an extra window like "split screen"?

Topic: 1763 Message: 1769

I had several very nice chats yesterday with the new version of V4 in the worst crowded conditions on 20 meters imaginable. And the text kept flowing. It was awesome.

I do not comment often here but I have to agree with others. A fast typist that is very chatty can really dominate the link when he is the ISS. Perhaps a timer of two minutes as the ISS can be implemented to keep the bucket mouth / hand guy such as I can be at times from dominating the link.

Many thanks. It really is good code in all other respects.

I will agree on this one, with Rick.

The latest version is working VERY good, with the Flex Radio. Installed it yesterday, and tried it to see if it worked okay. I think I woke up the East Coast. Lot of contacts.

It would be nice to know when others have stopped their QSO, and returned it back to you. Mabe a BK at the end, or OVER would help. I find myself typing in the buffer Q, and entering it in the outbound too soon. It never get to the other end. I know they are the ISS, but I thought it would go when they turned it over. No such luck. I finally kept listening for a string of "naks" to make sure I was the ISS.

Just my thoughts. Owen KB5XE Albuquerque, NM

From: Rick Muething
Topic: 1763 Message: 1774

Ron,
You're trying to circumvent the "no free lunch" theorem!....Everything has a cost. If you send data back with the ACK you HALF the throughput (data takes time ~3+ seconds, ACK/NAK take very little time ~300 ms). The ISS has to know how long to wait to repeat so if the IRS can optionally send data the ISS must wait to see if that is happening or you get "doubles".

Now you CAN send more data in less time by: (the theory for this is well known and proven)
1) Increasing the bandwidth (now 200 Hz, and can go into any spot on the band) You would have to increase the power proportionally to keep the same S/N ratio and bit error rate of course. And of course you get fewer QSO's per KHz. (You can thank Claude Shannon for that channel capacity vs. S/N theory that is so often quoted!)

and/or

2) Increasing the bits/symbol (now 2 including 1 FEC bit) e.g. PSK can send more than 2 bits/symbol but requires a stronger signal to keep the bit error rate the same. 4FSK is near optimum in terms of bandwidth and robustness especially in multipath propagation.

and/or

3) You can decrease the FEC coding (now at 50%) but that increases the bit error rate (and repeats) unless the signals are strong (The current V4 Viterbi encoding probably yields a coding gain of something > than 3 dB so you would have to more than double the power to keep the same bit error rate)

And then there is the real problem....How do you manage two data senders in a half duplex ARQ environment? ...virtually all half duplex HF protocols use an IRS ISS concept...and it is very difficult (under all missed frames, missed data and missed ACKs situations) to insure both stations don't ever become the ISS or the IRS at the same time.

Maybe I have missed something but I don't know how to make it more straight forward:
You can type and enter data at ANY Time.... You don't have to wait for anything. You never HAVE to send over or break or anything but typed text.
When the current sending station ISS runs out of data (all outbound data has been confirmed received) he Automatically sends IDLs
If the Current Receiving station has data to send (queued) and sees an IDL from the ISS it automatically starts the IRS>ISS switchover sequence to become the new ISS.
Repeat!

Rick KN6KB

Finn,

Pactor 3 uses 12 x the bandwidth of V4 (2400 Hz vs 200 Hz). You can’t have narrow bandwidth while sending large amounts of data UNLESS you have very high S/N. This goes back to Claude Shannon’s landmark theorem relating theoretical channel capacity (bits/second/Hz) vs. S/N. We are dealing here with HF where S/N is low, sometimes negative and multipath fading is common or severe at times. You simply can’t get the same bits/second/Hz as you do on a land line telephone with a stable channel at 40 dB S/N.

And of course you get fewer QSO's per KHz. (You can thank Claude Shannon for that channel capacity vs. S/N theory that is so often quoted!)

and/or

2) Increasing the bits/symbol (now 2 including 1 FEC bit) e.g. PSK can send more than 2 bits/symbol but requires a stronger signal to keep the bit error rate the same. 4FSK is near optimum in terms of bandwidth and robustness especially in multipath propagation.

and/or

3) You can decrease the FEC coding (now at 50%) but that increases the bit error rate (and repeats) unless the signals are strong (The current V4 Viterbi encoding probably yields a coding gain of something > than 3 dB so you would have to more than double the power to keep the same bit error rate)

And then there is the real problem....How do you manage two data senders in a half duplex ARQ environment? ...virtually all half duplex HF protocols use an IRS ISS concept...and it is very difficult (under all missed frames, missed data and missed ACKs situations) to insure both stations don't ever become the ISS or the IRS at the same time.

Maybe I have missed something but I don't know how to make it more straight forward:

You can type and enter data at ANY Time.... You
don’t have to wait for anything. You never HAVE to send over or break or
anything but typed text.
When the current sending station ISS runs out of
data (all outbound data has been confirmed received) he Automatically sends
IDLs
If the Current Receiving station has data to send
(queued) and sees an IDL from the ISS it automatically starts the IRS>ISS
switchover sequence to become the new ISS.
Repeat!

Rick. Off course. I just wondered how that P3 Picture transfer in one direction worked while some chat (450hz?) came the other way during the acks? It was said to work like that.

I don't know the GOLD P3 program myself, so I may have got it wrong. SW perhaps only from time to time made some ordinary turnarounds ISS/IRS/ISS.

Anyway forget about it. I didn't intend squeezing picture through the 200hz channel. Irrelevant to V4 and the genious 200Hz solution.

The different font issue for helping hams having coulour disabled visual is maybe something to consider down the lane. I don't have that problem myself, so don't really know myself.

This goes back to Claude Shannonâ□□s landmark theorem relating theoretical channel capacity (bits/second/Hz) vs. S/N. We are dealing here with HF where S/N is low, sometimes negative and multipath fading is common or severe at times. You simply canâ□□t get the same bits/second/Hz as you do on a land line telephone with a stable channel at 40 dB S/N.

Hi Rick and Finn,

Perhaps the 3rd window idea is great because it suits everybody.
I understand that V4 cannot be made a pseudo fullduplex mode just like Pactor 2 or 3 can, but the 3rd window seems a good idea.
That is of course whenever you have the spare time.

Constellation score shows how well we are receiving but something to indicate how well we are being received would be nice. Very good reasons of throughput why you don't want to bring that back, but could something simpler be done based on the counting of ACK and NACK frames. (ACK-NACK)/(ACK+NACK) sounds like a possible measure. Or effective data rate based on throughput.

Bob,

The sender (ISS) and the receiver (IRS) always have the information to calculate true throughput (NET Characters/min or WPM). ACK NAKs are only part (what about missed ACK/NAK ....they cause repeats too). I'll look at calculating and displaying something like a rolling average (say one minute) of actual throughput (bytes Accepted /minute). None of this causes any impact to the throughput (minor CPU load increase) but does of course clutter up the screen with more "widgets".

My input regarding the user interface on V4
First and foremost congratulations to you Rick on getting the V4 code running very well indeed!
I would find the interface much more comfortable to use if nothing but received text appeared in the receive window and of course a separate window like we have now to type in. What would be VERY helpful is a small third window displaying the outgoing text that has been received by the IRS. This way you would be aware of your throughput and not get too verbose under poor conditions. You would be seeing exactly what the IRS has displayed to the moment.
The constellation, while interesting, is something I would gladly do without to have this third window of received text by the IRS displayed, if keeping the amount of program code to a minimum is is important, and I think of course that it is.
From all the posts I have read this morning, I think that the majority of the uses want to see the actual transmitted text they send as it is displayed at he IRS.
Oh.. A last thought on the on the tendency of many of us to want to do the "BTU OM" thing, even though we understand the changeover from ISS to IRS is automatic. I simply end my typing by typically asking a question. This seems to to work pretty well in getting the other guy to type a reply. ;-)

1791. Re: [V4Protocol] Re: V4 GUI improvement proposal

Yahoo group: V4Protocol
Date: 2011-09-07 15:15:23 UTC
From: Rick Muething
Topic: 1763 Message: 1791

Thanks, Russ.

I am working on some tweaks but since these all relate to GUI there is no “Right” answer and it is possible to throw too much clutter in there and make things more confusing.
I am working now on some fairly simple but useful items: (These are ALL related to the V4Chat program NOT the Virtual V4 TNC program)
1) Moving some of the less used menu items to the File drop down list...this clears up the menu bar for the items below.
2) Adding a Out bound Queue readout and progress bar to the main menu line (this will “repeat” the Outbound Queue value now shown on the V4 TNC)
3) Adding an average (1 minute rolling average) throughput readout and progress bar to the main menu line

I will investigate changes to the text boxes but I am reluctant to add yet another (third) text box. That means an additional set of sliders for adjustment and gets messy.
An alternative I am considering is letting the current keyboard text box just show entered text. Text that can still be “edited” (that has not be committed to the outbound Queue) would be shown say in blue italic text. Once text is committed to the outbound queue it would be shown (in the same text box) as black Italic font. This clearly shows which text has been sent to the queue and keeps all the outbound text together in one scrolling text box. The session screen can either be kept the way it is (that is really good for logging since it contains both inbound and outbound text and status messages or it could be purged of outbound text. The issue with this is one has to look at the entire picture...e.g. What do you want the log to contain and in what sequence in addition to what the Text box functions are.
The constellation display is on the V4 TNC...and that is useful for several reasons in addition to showing received symbol quality....It does not affect the text windows or any of the V4 Chat GUI. (you can operate V4Chat fine with the V4 TNC minimized if desired) It is important to remember that the Virtual TNC function (the V4 TNC.exe program) and the GUI user interface (The V4Chat.exe program) are separate. In the future there will probably be other developers that wish to implement their own GUI interface and still use the V4 TNC Virtual TNC or include V4 into existing host programs (that has already been done with WINMOR which also uses the “Virtual TNC” concept). Although some have trouble grasping the concept most now understand that these software implemented “Virtual TNCs” operate almost exactly the same as a physical TNC and appear to the host program as just another TNC with a specific set of commands just like a KAM or PTC II or other hardware TNC. All that is required to add V4 or WINMOR to and existing host program is to write the correct driver for the virtual TNC. This is not a difficult task and the interfaces and commands for both V4 and WINMOR are well documented.
It is important NOT to get too bogged down and attempt to make the V4 Chat program the software equivalent of a Swiss army knife! There are are still important tweaks that can be done to improve the robustness and reliability of the raw V4 protocol. Those steps usually take time and are in small increments but they do add up (Pactor for example is now over 20 years old and has been advanced from modest Pactor 1 at 100 bits/second to now Pactor 4 at over 4000 bits/second) All that happened by taking advantage of advancing hardware and

software technology and DSP theory with a very heavy dose of just plain good engineering work.
Whenever I look at adding functions and other “bells and whistles” I always try and remind myself of an inspired saying: “ More software dies of indigestion than starvation!”
Your inputs always welcome but at this stage it is also important to “think through” each suggestion to asses its total impact to all parts of the program, logging, user complexity etc. The GUI functionality is not always obvious and not simple to implement well.

Topic: 1763 Message: 1796

Hi Rick,

Interesting thread.

I think an EAS option (echo as sent) should simply transfer the sent text, as it was acked, from bottom window to top. In a distinctive color. The speed at which that happened would be a direct indication of link quality. It worked very well in Amtor.

As for IRS ability to force the link around, here again this was a very useful feature in Amtor (ACHG). Impolite to use in normal QSO but sometimes handy - like when you were communicating with an unattended station.

I am calling and listening on 14073 right now!

Bernie,
I’m not sure I follow your conditions. I’ll play with it more later today.
The RX windows never really “fills up” it has an almost unlimited buffer it just scrolls. The scroll lock button only activates if you have scrolled and another buffer holds incoming data until you release the scroll lock (Click the scroll lock button) . Normally you don’t need to ever clear the buffer (right click) unless for some reason you want a “clean slate”.

Chris,

Thanks for the inputs. I am cleaning up some additions now that should be useful and don't clutter up the display much. e.g. Rx and Tx throughput measurements shown on the V4Chat form (1 minute rolling average) . I think users will find this helpful

Re the IRS ability to interrupt (grab back the ISS status while the ISS is sending data). This is technically possible but I am not sure I understand the need and it can easily add confusion... e.g. what do you do with the buffered unsent outbound data at the ISS? Dump it?, Keep it for the next time it is the ISS etc. These are important details that if not implemented well and consistently will likely confuse the user.

The unattended station issue should not a factor here. An unattended station will never generate outbound data so the IRS can always "force the link around" by simply typing data to send. If the unattended station were the ISS it would be sending IDLs (until timeout occurred) so the IRS does not have to "interrupt" the ISS.

V4 Chat is not really intended for unattended operation. There are other sound card protocols (e.g. WINMOR) that are specifically designed for message transfer and would be a better choice for unattended operation.

73,

Rick

From: k1dow_4
Topic: 1763 Message: 1801

Rick,
Thanks for your very clear and concise reply to my input regarding "the third widow" showing where the the IRS station was at regarding receiving the actual text to the moment that you, as the ISS are typing to him. I also appreciate your defining the difference between the V4 portion and the interface portion of your program. Points well explained. I can see why you do not want to create a "Swiss Army Knife" out to the interface. ;-)
I very much like your idea of keeping all the text I type in the text typing window. I find it messy and unsettling to have it appear inter spaced with received text in the incoming window. Your idea of having what the ISS station types change color regarding it's state (while keeping all typed text in the typing window) would be great, save for those who are color blind. I still would like to see a one line only window (like a ticker tape) between the TX window and the RX window. It could scroll horizontally (as ticker tapes do) showing a few of the words you have typed that are about to be transmitted and having them drop off the display as they are acked. It's my feeling that this would give a very positive reassuring feel to the program, and since "the single line ticker tape window" would not require scrolling, slide bars, etc, could this be implemented with out to much duress?
The only other thing I can think of at this time (which I don't think would be too difficult) would be to be able to mark text with my mouse in the RX & TX windows and copy it. Not essential, but handy..

> I am working now on some fairly simple but useful items: (These are ALL related to the V4Chat program NOT the Virtual V4 TNC program)
> 1) Moving some of the less used menu items to the File drop down list...this clears up the menu bar for the items below.
> 2) Adding a Out bound Queue readout and progress bar to the main menu line (this will â□□repeatâ□□ the Outbound Queue value now shown on the V4 TNC)
> 3) Adding an average (1 minute rolling average) throughput readout and progress bar to the main menu line
>
> I will investigate changes to the text boxes but I am reluctant to add

yet another (third) text box. That means an additional set of sliders
for adjustment and gets messy.
> An alternative I am considering is letting the current keyboard text
box just show entered text. Text that can still be
â□□editedâ□□ (that has not be committed to the outbound Queue)
would be shown say in blue italic text. Once text is committed to the
outbound queue it would be shown (in the same text box) as black Italic
font. This clearly shows which text has been sent to the queue and
keeps all the outbound text together in one scrolling text box. The
session screen can either be kept the way it is (that is really good for
logging since it contains both inbound and outbound text and status
messages or it could be purged of outbound text. The issue with this is
one has to look at the entire picture...e.g. What do you want the log
to contain and in what sequence in addition to what the Text box
functions are.
> The constellation display is on the V4 TNC...and that is useful for
several reasons in addition to showing received symbol quality....It
does not affect the text windows or any of the V4 Chat GUI. (you can
operate V4Chat fine with the V4 TNC minimized if desired) It is
important to remember that the Virtual TNC function (the V4 TNC.exe
program) and the GUI user interface (The V4Chat.exe program) are
separate. In the future there will probably be other developers that
wish to implement their own GUI interface and still use the V4 TNC
Virtual TNC or include V4 into existing host programs (that has already
been done with WINMOR which also uses the â□□Virtual TNCâ□□
concept). Although some have trouble grasping the concept most now
understand that these software implemented â□□Virtual TNCsâ□□
operate almost exactly the same as a physical TNC and appear to the host
program as just another TNC with a specific set of commands just like a
KAM or PTC II or other hardware TNC. All that is required to add V4 or
WINMOR to and existing host program is to write the correct driver for
the virtual TNC. This is not a difficult task and the interfaces and
commands for both V4 and WINMOR are well documented.
> It is important NOT to get too bogged down and attempt to make the V4
Chat program the software equivalent of a Swiss army knife! There are
are still important tweaks that can be done to improve the robustness
and reliability of the raw V4 protocol. Those steps usually take time
and are in small increments but they do add up (Pactor for example is
now over 20 years old and has been advanced from modest Pactor 1 at 100
bits/second to now Pactor 4 at over 4000 bits/second) All that happened
by taking advantage of advancing hardware and software technology and
DSP theory with a very heavy dose of just plain good engineering work.
> Whenever I look at adding functions and other â□□bells and
whistlesâ□□ I always try and remind myself of an inspired saying:
â□□ More software dies of indigestion than starvation!â□□
> Your inputs always welcome but at this stage it is also important to
â□□think throughâ□□ each suggestion to asses its total impact
to all parts of the program, logging, user complexity etc. The GUI
functionality is not always obvious and not simple to implement well.

OK Rick, thanks for clearing up the use of the (right click) function.

It appears that once you clear the buffer (right click), no more RX text appears in the RX window. I'll experiment some more and see if I can reproduce 100% of the time.

All other functions of V4 Chat work 100% in my setup.

Bernie.

1803. V4 signals decoded in Edinburgh 2011:08:08 18:30/19:30

I am glad that someone else has run into the same problem. I am using Windows XP Pro here with all the latest MS patches including up-to-date .NET code.

The workaround, for now, is not use <right click> until Rick can figure out how to solve this low priority issue.

It seems that AVG doesn't like the V4 program. I got a virus alert today with it. I'm sure it's a false positive but what in it would do this?

Also just worked SV1UY from FN75cm. Although conditions were pretty terrible.

Well just to clarify the situation a bit... I am not worried about it. However it was something that V4 did when running that triggered AVG. So it might have been a burp between something else I was running and V4. I did a scan of the folder, the program and nothing is wrong with it. I have used V4 in the past and nothing ever happened to trigger an AVG alert. I only mentioned it just in case it was a bug or something. I am sure it was a false positive. I don't even remotely think anything is actually sinister about it.

Happy trails.

It seems that antivirus software can spark as lively a debate as politics or religion. There are free and pay versions and each has their cult following. The misinformation about anti virus software floating around is only rivaled by the gain of CB antennas. That being said, Microsoft has an antivirus called "Microsoft Essentials" that is both free and plays well with Windows, as you would expect because both are written by the same folks. I have had zero problems since switching from AVG a couple of years ago.

Hi all,
Just had a surprising contact with Robert, V31AE. 05:51 UTC, 14073. Very good in that there was 0 signal strength, and very weak, and probably 50% repeats, but we got the message thru...
Rick, great to see the Date/Time stamp on the CQ etc. in the RX screen. Helps a lot. Very usefull when away from station, and upon return see a CQ, and wonder if worth calling back. Thank you.

So, will be listening 14073 around 04:00 UTC, and sometimes 7073 around 14:00 UTC.

Cheers

Paul Whitaker.

Thanks Paul,

Just finishing up a few more tweaks and nice GUI changes. Should get those released in the next day or so:
Echo as sent (the blue italic sent text will be shown in the session window when sent (FEC mode) or when ACKed (ARQ mode). This turned out to be easier than I thought.
Keyboard text box will hold/scroll all entered (keyboard or file) text. Text already sent to the outbound queue will be dark gray, text still in edit stage will be blue italic.
Throughput indicator (both Rx and Tx) shows actual 1 minute rolling average of characters per minute.
OB Queue status mirrored over to V4Chat form as well as V4 TNC form.

I think users will find the above much better for the GUI.

Paul/All

OK I think I know what triggered the Virus alert. This latest version (0.5.3.0) has auto update enabled and that will every so often (usually a couple of minutes after startup and then every two hours or so) go out to the auto update server (HTTP port 8776) and check for available updates. (it downloads a small text file that says what is available). Depending on how your security is set up that can trigger a “potential virus” alert or even block the auto update request.
Be assured I am the only one uploading files to the auto update server and each file is verified virus free prior to upload.

On my AVG Internet security (not the free version) when it sees a program try to make an internet connection it asks is it OK and if I want to make a permanent rule allowing that program to access that port etc. Other virus filters or firewalls do something similar.
Just remember if you disable auto updates (either through the setup menu or by blocking access to the server on port 8776) you will have to manually update in the future.

This is sounding good, Rick! I'm anxiously looking forward to trying out the graphic tweaks you described.
Regarding the right click issues in the text boxes, would it be possible to just invoke the typical MS right click menu for editing, clearing, copying, pasting, etc., as it would seem these functions are already in the MS OS and perhaps need only to be invoked.
73/Russ

Hi Paul

Your signal was 559 in Edinburgh but I think mine dropped into the noise your end. I was surprised how the data was flowing..Will have to increase my typing speed as well as fill a few files to give time for sipping coffee.

A few stations heard this morning in Edinburgh so maybe some action later.

140730 is between the devil and the deep blue as at 140760 we have the JT65 boys and at 14700 we have the PSK boys some of who have not learnt how to use the screen display for frequency adjust so drift up the band. In Europe 140730 is probably as good as it gets and this mode seems to work amongst the adjacent channel noise.

John. GM4ZQH

PS......Note I have revised my user name to Call Sign....Forthsailor has gone to sea :) :)

From: Rick Muething
Topic: 1763 Message: 1831

Russ,
The next version will have the functionally you wish:
1) The text entered (either via keyboard or pasted file) will always be shown in the current keyboard window. The portion of the text that has been sent or in the process of sending (e.g. waiting in the OB queue) will be dark gray, text you can edit will be blue. You can clear the window if desired or just let it scroll. (BIG scroll buffer)

2) There is no need for a third “text in process” window. The new scheme copies data as sent (sometimes called Echo as Sent) to the session window when it is actually sent so you can always see exactly what text has been sent (and in the case of ARQ, ACKed). This also has the nice affect of making the log completely chronologic...text appears in the log when it was sent/ACKed by the other side. For non full duplex operation this will automatically separate received text from sent text both by color and by time/grouping. For ARQ operation you know that when the sent data (blue italic font) appears on your Session window it ALSO and Simultaneously appears on the remote stations Session window. No question as to what data the other side has received!

3) You can already copy text in either window as described in help...
Use a left mouse click and drag to highlight text
Use Ctrl C to copy the highlighted text to the clip board.
Position the cursor where you want to paste (can be a different application if desired)
Use Ctrl V to paste at the cursor.

The Ctrl C and Ctrl V are pretty standard for copy and paste. I could go to use the right mouse click for that but then we need a different key stroke (not standard) to allow erasing the entire Keyboard or Session windows. Those windows can hold a lot of type so it is not always practical trying to select all the window data to clear it.

I should have this out today or tomorrow.

Paul/All

OK I think I know what triggered the Virus alert. This latest version (0.5.3.0) has auto update enabled and that will every so often (usually a couple of minutes after startup and then every two hours or so) go out to the auto update server (HTTP port 8776) and check for available updates. (it downloads a small text file that says what is available). Depending on how your security is set up that can trigger a “potential virus” alert or even block the auto update request.
Be assured I am the only one uploading files to the auto update server and each file is verified virus free prior to upload.

On my AVG Internet security (not the free version) when it sees a program try to make an internet connection it asks is it OK and if I want to make a permanent rule allowing that program to access that port etc. Other virus filters or firewalls do something similar.
Just remember if you disable auto updates (either through the setup menu or by blocking access to the server on port 8776) you will have to manually update in the future.

Fred,

Then entire auto update mechanism:
Downloading the (specially formatted) text file telling what “patches” are available for what versions (You can’t easily make this file up manually and it makes very uninteresting reading!).
Interpreting the text file based on the current version to determine which zip to download.
Downloading the autoupdate zip file based on the current version
Unzipping the autoupdate Zip file
Backing up all current file versions to “.old” versions
Replacing all target files with new versions
Recovery “rollback” if any problem detected
Notification that auto update is complete and to restart manually to run the new version

Is all done automatically. This is essential because the format and exact sequence of all this is critical and must be done by the program.

For those that don’t want to auto update or have (for whatever reason) their access to HTTP port 8776 blocked they will have to go to the Yahoo FTP site (later also the Winlink site) and download the full install and do the manual uninistall/reinstall dance.

We developed and are using this sophisticated and reliable mechanism over the past few years.

From: Fred G -w1wyc
Topic: 1809 Message: 1837

Hi Rick,

Autoupdate does a lot of work. Thanks for the explanation.

73,
Fred, W1WYC

Subject: Re: [V4Protocol] Re: V4 and AVG

Fred,

Then entire auto update mechanism:
Downloading the (specially formatted) text file telling what “patches” are available for what versions (You can’t easily make this file up manually and it makes very uninteresting reading!).
Interpreting the text file based on the current version to determine which zip to download.
Downloading the autoupdate zip file based on the current version
Unzipping the autoupdate Zip file
Backing up all current file versions to “.old” versions
Replacing all target files with new versions
Recovery “rollback” if any problem detected
Notification that auto update is complete and to restart manually to run the new version

Is all done automatically. This is essential because the format and exact sequence of all this is critical and must be done by the program.

For those that don’t want to auto update or have (for whatever reason) their access to HTTP port 8776 blocked they will have to go to the Yahoo FTP site (later also the Winlink site) and download the full install and do the manual uninistall/reinstall dance.

We developed and are using this sophisticated and reliable mechanism over the past few years.

☐

Hiya Rick,

You mentioned a text file that's loaded prior to the download. Is this text file automatically displayed or is it in the
Winmor directory and has to be opened manually. ?

Paul/All

OK I think I know what triggered the Virus alert. This latest version (0.5.3.0) has auto update enabled and that will every so often (usually a couple of minutes after startup and then every two hours or so) go out to the auto update server (HTTP port 8776) and check for available updates. (it downloads a small text file that says what is available). Depending on how your security is set up that can trigger a “potential virus” alert or even block the auto update request.
Be assured I am the only one uploading files to the auto update server and each file is verified virus free prior to upload.

On my AVG Internet security (not the free version) when it sees a program try to make an internet connection it asks is it OK and if I want to make a permanent rule allowing that program to access that port etc. Other virus filters or firewalls do something similar.
Just remember if you disable auto updates (either through the setup menu or by blocking access to the server on port 8776) you will have to manually update in the future.

> 1) The text entered (either via keyboard or pasted file) will always
be shown in the current keyboard window. The portion of the text that
has been sent or in the process of sending (e.g. waiting in the OB
queue) will be dark gray, text you can edit will be blue. You can clear
the window if desired or just let it scroll. (BIG scroll buffer)
>
> 2) There is no need for a third â□□text in processâ□□
window. The new scheme copies data as sent (sometimes called Echo as
Sent) to the session window when it is actually sent so you can always
see exactly what text has been sent (and in the case of ARQ, ACKed).
This also has the nice affect of making the log completely
chronologic...text appears in the log when it was sent/ACKed by the
other side. For non full duplex operation this will automatically
separate received text from sent text both by color and by
time/grouping. For ARQ operation you know that when the sent data (blue
italic font) appears on your Session window it ALSO and Simultaneously
appears on the remote stations Session window. No question as to what
data the other side has received!
>
> 3) You can already copy text in either window as described in help...

> Use Ctrl C to copy the highlighted text to the clip board.
> Position the cursor where you want to paste (can be a
different application if desired)
> Use Ctrl V to paste at the cursor.
>
> The Ctrl C and Ctrl V are pretty standard for copy and paste. I could
go to use the right mouse click for that but then we need a different
key stroke (not standard) to allow erasing the entire Keyboard or
Session windows. Those windows can hold a lot of type so it is not
always practical trying to select all the window data to clear it.

1840. V4Chat Update 0.6.0.0

Yahoo group: V4Protocol
Date: 2011-09-11 18:50:55 UTC
From: kn6kb
Topic: 1840 Message: 1840

All,
This is a significant update but should still be compatible with prior versions after 0.5. There have been significnt changes in the V4Chat GUI and main menu line. Please read the help at least in the sections that describe the V4Chat main menu.

There is some sort of issue with the HTTP auto update server which we are trying to resolve. I compiled this version to use the FTP autoupdate server (uses FTP port 8777) but that will not help those with 0.5.3.0 autoupdate to this version. So at least this time you will have to uninstall, reinstall using the same procedure as the past. No settings will be lost.

Let's flush out any remaing bugs (I think I have all those reported fixed) in this prior to doing any more GUI tweaks. I think you'll find this GUI and use of the session text box much better.

Good luck,

Rick Muething, KN6KB

V4 Chat Revision History

Date: Rev Change Summary

Sept 10, 2011 0.6.0.0 Beta release of 0.5.3.1

Sept 6, 2011 0.5.3.1 Checked auto update and made cleanup of logging and prevention of close during update.
Added OB Queue label to V4Chat main window based on BUFFER reports from V4 TNC.
Added Tx and Rx throughput calculations (~1 minute rolling avg) and throughput progress bar.
Modified menu line to move some items to "File dropdown" section to make room for progress bar.
Fixed problem in UpdateSessionDisplay that cause permanent error after a right click clear of the session window.
Added mechanism to display Data as sent (FEC mode) adn Data as ACKed (ARQ mode) (blue italic text in Session RTB)
Fixed bug in "Paste and Send" function where data was not being shown on the Keyboard RTB
Made modifications in UpdateSessionDisplay to insure Status and Alerts are always on a separate line.
Updated Help

V4 TNC Revision History

Date Rev # Summary ofChanges

Sept 10, 2011 0.6.0.0 Beta release of 0.5.3.1

Sept 7, 2011 0.5.3.1 Added Send of BUFFER command whenever OB Queue display value is updated (allows V4 Chat to monitor buffer)
Added mechanism for "Echo as Sent" allowing host applicaiton to display transmitted data as sent (FEC mode) or
as ACKed (ARQ mode).
Added "SC Cal offset" to ini file for AR if < 2012
Fixed problem where clear of OB Queue was not being reported on timouts and aborts.

1841. Re: [V4Protocol] V4Chat Update 0.6.0.0

Hiya Rick,

I downloaded 0.6.0.0 and installed it.
It was a little scary when I tried it and there was no transmilt.
I found I had to get into setup and redo the radio setup.
But all appears ok after doing that.

I noticed this morning that when I looked at the exception file that autoupdate
didn't work but I guess you are aware of it and it'll be fixed. At first I thought
I had a problem but I'll wait for email saying "All is well" then I'll look into my
problem if I have one.

After install it appeared to work fine keying TX via CAT, but I noticed it was using FSK for the CWID. So I delved into Radio Setup and found settings appeared to have defaulted. Now restored and CWID back to normal. I had not upgraded to 0.5.3.0 and was at 0.5.2.2 (the patch). Anyway not a real problem but I don't recall a problem with any previous upgrade.

Hiya Bob,

I don't use TX via CAT. I use a separate COMPORT for keying.
I use CAT but the FT-920 doesn't like TX.
I was running 0.5.3.0 until I updated. All appears fine.

I had to reset all my radio and PTT settings but no problem with it. I am glad the log book stayed put.

I just made a qso with AA1CZ on backscatter and all I can say is WOW. Hardly any signal, tons of noise, QSB, and QRM and still made a contact without too many resends. Under ideal circumstances this is going to be one heck of a mode. I remember the old days when I was an avid AMTOR fan. This is way better. I love the way it's working now with the data sent. Outstanding. Now I want to make a few more QSOs if the sun would start cooperating. I just like to say a big WOOO HOOO to Rick.

All,
Version 0.5.3 corrected some problems in the radio setup settings in the ini file. If you didn’t run that version you’ll have to go and use the radio setup menu to re enter the settings. Another good reason to keep current. Hopefull after this auto update should be working.

Hi Ron and everyone.

At least three of us here down under have the new version 0.6.0.0 installed and running .. Clive ZL1FZ, John VK5PO and myself. All on 14073 USB dial.

We have enjoyed some solid ARQ contacts (the path Auckland to Adelaide is a couple of thousand miles I guess) despite weak signals and a more or less flat band. V4 is clearly going to be a winner!

Delighted that after all these years Amtor has a powerful replacement and no hardware TNC needed. Once other experience the very relaxed and different style of ARQ I think there will be a lot of converts.

Sincere thanks Ron for bringing us to this point.

Hi Guys,

Running the latest as of this morning my time.

Somewhat distressing. I was listening (as in hearing) to
that exchange all the way through. I saw John put out his initial CQ,
resolved perfectly, and heard many exchanges thereafter but resolved
nothing.

Having said that I was 'listening' in FEC FD mode, I had
expected to be able to 'monitor the QSO at least, or are the protocols so
different FEC FD won't resolve ARQ? Maybe I should RTFM..

Regards,

Ian

Hello Steinar,

You wrote:

As I understand it, you have NEVER had the 756 working with V4? Is this correct?

V4 CAT works fine with my Icom 7000 and 706. And most all newer Icom radios use the same settings - except address (which is unique for each model). Check the 756 set mode menu to be sure; address might be changed from original value. Whatever address is in 756 radio set mode menu must be entered in the in V4 radio setting.

Check V4 setup radio settings:

1) V4 Radio "select model" should be "Icom amateur radios"

2) Icom address box entry must match your radio.

3) Com port must match your interface box or CIV cable.

4) Com port speed. Try 9600 or 19,200. Icom is usually auto-baud.

5) DTR/RTS settings depend on your interface box. My home brew interface requires DTR on and RTS off.

For PTT the "CI-V" setting should work with 756

To verify if your CAT works. Enter a few different frequencies in your log table (left side of chat screen). Click on one freq and then another. Radio should follow.

Good luck, Chris ZL1BOE

Correction, In all probability my CAT was not keying the radio after the install, I later found that I had "Digi Vox" left engaged from testing another mode. But glad that this was resolved. Loking forward to proper testing.

I compiled this version to use the FTP autoupdate server (uses FTP port 8777) but that will not help those with 0.5.3.0 autoupdate to this version. So at least this time you will have to uninstall, reinstall using the same procedure as the past. No settings will be lost.

Ian,
You can listen to an ongoing ARQ or FEC transmission or QSO in either FEC mode or ARQ (if unconnected of course). So most of the time you can just use ARQ mode unless you actually want to SEND an FEC (unconnected) transmission. Full duplex means that (in FEC mode) it is possible to send and receive at the same time (at least the audio). Most Radio hookups of course can’t operate full duplex especially on HF.

If you are having marginal copy try setting the squelch lower (say 3 or 4). It will be more sensitive but will also show some “open” printing since on FEC mode (or monitoring with ARQ) you don’t have the extended sync of the session ID in a normal connected ARQ connection.

Running great here. Thanks for the fine tweaks to the GUI, Rick! Everyone is pleased as you can see. :-)

I know that you now want to concentrate on any possible further debugging regarding the V4 protocol, but please consider this one last request regarding the GUI. I (and some of my QSO partners) have found that it's possible to end up with your cursor out of the TX data box you need to type in when in a QSO. Pretty frustrating if you have to peer at your keyboard to type and then look up to find that what you thought you typed in the TX box is not there because the cursor is (most likely) up in the RX box. My request is that the cursor be made to jump back in the TX dialog box as soon as you strike a key on the keyboard to begin your dialog. That way no more "out of the box" typing. I hope I was able to present this anomaly clearly..

Regarding the V4 protocol, the only thing I notice that i would question is that I do great as the ISS but there seems to be a considerable amount of negotiation by the V4 controller before the other station takes over as ISS, even when I signal that I wish to be the IRS by sending a "K". This could all be because my QSO partner doesn't have anything typed into his TX buffer ready to send, however. Just mentioning it, in case this "could be" a bit of a issue. That's it. Carry on with the excellent job, Rick!

Russ,All

I'll look into the jumping cursor....I didn't notice that all all here on my tests.

Re switchover from ISS to IRS. What you type in the ISS Keyboard has nothing to do with the speed or action of the ISS>IRS switchover.
It will switch over automatically WHEN:
1) There is no more data pending in the ISS outbound queue (ISS OB Queue is 0)
2) The ISS has sent a short IDL frame (it repeats this if necessary as long as the OB queue is 0.)
3) The IRS has something to send...e.g. IT'S OB queue is NOT empty
4) The ISS receives the IDL from the IRS in response to its sent IDL indicating the IRS has something to send.
5) The IRS finally receives the ACK from the ISS in response to its IDL indicating the sequence has completed.

If the link is decent (IDLs and ACKs are pretty robust) and the IRS has data to send this whole IRS<>ISS exchange takes about 3 seconds. (ISS IDL, IRS IDL, ISS ACK). That seems complex but it is absolutely necessary to INSURE both stations never become the ISS or the IRS. As ISS if the IRS has no data to send you can send K, BTU, OVER or whatever until the cows come home but it won't switch.

One thing people sometimes don't grasp is that as IRS you can go ahead and type text and enter it to the IRS outbound queue waiting for that IDL signaling the ISS has finished. You don't have to wait until you become the ISS to start typing.

This all takes a bit of practice but the new format of Echo as Sent/ACKed will allow the sender to know exactly what has been sent to and received by the other station much better.

John,

I just updated this yesterday (same data different formats) and will upload to the web site with a full programmers package (including all the necessary dlls) in the next day or so. The protocol spec still needs some work but this should be good enough to use the V4 TNC. Very similar to the WINMOR TNC in terms of interface...but of course commands are different. One nice addition is the Echo as sent feature which allows you to see/display the data as ACKed (ARQ Mode) or Sent (FEC mode).

Let me know if you have questions or if you find errors in the documentation.

<snip>

Rick, your explanation about link turn-around was most helpful. However, it would be useful to know how long the turn-around might take when the link is NOT so decent? Does this situation not enhance the case to include a +? command to force the link around without all those checks needing to be done? It's use would be at ISS discretion.

You encourage the IRS to go ahead and enter some text into the IRS outbound queue but sometimes what one enters may be made irrelevant by what the ISS types next. Line "whats your name BTU" and the IRS then gives his name. So the IRS may sometimes prefer not to do this. Or omit to use sp/sp to get his reply into the buffer. In Amtor using the +? was a good way to prompt the newly elected ISS that the 'ball was now in his court' so to speak.

Having said all that I was absolutely delighted yesterday to make a perfect link with Robert V31AE in Belize. Under very marginal band conditions and with a station and antenna at my end that is normally hardly marginal for long haul even with the band wide open! I am sold!

Chris,
The use of a +? Over or any other command would actually be slower. For one thing the current ACK and IDL used are the shortest possible frames (no data...just a specific sync signal and session ID.... a total of 8 symbols + leader). There is some timing buffer on either side of these Sync frames which are necessary to accommodate all the possibilities in 2) below.

Also when ever you say “send something from the IRS” you must remember:
1) The IRS is only normally ACKing or NAKing and that is what the ISS is expecting...You can’t arbitrarily stick in a data frame (longer) from the IRS or you run the very real possibility of a “double” (both the IRS and the ISS transmitting at the same time...no one is listening! and a sure way to kill the link.
2) When you think of something like a IRS<>ISS switchover you ABSOLUTELY MUST accommodate all possibilities of missed frames:
What if the IRS missed the ISS IDL?
What if the ISS missed the IRSs ACK?
What if the ISS missed the IRS IDL (or other request for OVER)
What if the IRS missed the response from the ISS in response to the request for over?

You MUST accommodate all of these possibilities no matter how remote ...they will all happen in time and if not designed correctly you end up with two ISS or two IRS and then the link is essentially lost. A very similar type of mechanism is done in WINMOR and it works and works reliably.

To answer your question on what if the link is poor...well certainly it could take more time...instead of the exchange of 3 short frames (e.g. ISS IDL, IRS IDL, ISS ACK) you might have to repeat some of those multiple times...but remember these are the shortest and most reliable frames...they contain no data only very strong FEC frame type and Session ID info. If they can’t get through with a few repeats you don’t have enough propagation to run the link...and you’ll probably never be able to get data through.

While I don’t have much experience with AMTOR, Pactor uses some similar types of changeovers but even Pactor can get hung (and the link rendered useless) if there is a synchronization issue with the IRS<>ISS changeover.

This is the crux and the real challenge of making a bullet proof protocol and unfortunately there are no shortcuts and simple answers.

As ISS if the IRS has no data to send you can send K, BTU, OVER or whatever until the cows come home but it wonâ☐☐t switch.
>
> One thing people sometimes donâ☐☐t grasp is that as IRS you can go ahead and type text and enter it to the IRS outbound queue waiting for that IDL signaling the ISS has finished. You donâ☐☐t have to wait until you become the ISS to start typing.
<snip>

Rick, your explanation about link turn-around was most helpful. However, it would be useful to know how long the turn-around might take when the link is NOT so decent? Does this situation not enhance the case to include a +? command to force the link around without all those checks needing to be done? It's use would be at ISS discretion.

You encourage the IRS to go ahead and enter some text into the IRS outbound queue but sometimes what one enters may be made irrelevant by what the ISS types next. Line "whats your name BTU" and the IRS then gives his name. So the IRS may sometimes prefer not to do this. Or omit to use sp/sp to get his reply into the buffer. In Amtor using the +? was a good way to prompt the newly elected ISS that the 'ball was now in his court' so to speak.

Having said all that I was absolutely delighted yesterday to make a perfect link with Robert V31AE in Belize. Under very marginal band conditions and with a station and antenna at my end that is normally hardly marginal for long haul even with the band wide open! I am sold!

Thanks Rick,
I think you hit on the answer for what sometimes seems like a long delay in becoming the IRS when I have finished what I have to say and am waiting for my QSO partner to become the ISS. I too suspect that some don't realize that they can type ahead while receiving and have it ready to go out as soon as they become the ISS. The delay I sometimes experience in waiting for his data to start to arrive is probably do to the fact that he has not typed anything ahead to send when I stop sending and only then begins to type something which will not be sent until he puts it into the TX buffer.

Russ,

I have been trying to duplicate the reported problem of the “jumping” cursor and can’t. There must be a cursor (and only one cursor) at any time. It should (and at least on my tests) appears to stay where you put it. If however you move the mouse around to the Session text box or the mini log or even to another application and click the cursor will be there and you will not be able to type data into the Keyboard text box until you move the mouse there and click (putting the cursor there). Remember you can’t type into text that has already been committed to the outbound queue (dark gray text) ...you can only type at the end of the keyboard text box or inside any blue italic type...Gray type should be considered “gone”...although it still may be sitting in the outbound queue.

If you are having a problem describe it in detail. How does the cursor leave the Keyboard box? Is it some action of yours (mouse action)? Is it another application stealing “focus”? Once you start a QSO you should not have to move the cursor out of the keyboard text box unless you need to interact with some other program, update the mini log etc.

There are many ways of grabbing the focus and putting the cursor back to a specific spot (e.g. on a link turnover) but most users would find that annoying...what if I am checking mail, or editing a text document or ???

I need some specific details on what is happening and when.

We can tweak these finer points of GUI but it is also important to obey the common rules about cursors, cut, paste etc. that most of us are used to.

Running great here. Thanks for the fine tweaks to the GUI, Rick! Everyone is pleased as you can see. :-)

I know that you now want to concentrate on any possible further debugging regarding the V4 protocol, but please consider this one last request regarding the GUI. I (and some of my QSO partners) have found that it's possible to end up with your cursor out of the TX data box you need to type in when in a QSO. Pretty frustrating if you have to peer at your keyboard to type and then look up to find that what you thought you typed in the TX box is not there because the cursor is (most likely) up in the RX box. My request is that the cursor be made to jump back in the TX dialog box as soon as you strike a key on the keyboard to begin your dialog. That way no more "out of the box" typing. I hope I was able to present this anomaly clearly..

Regarding the V4 protocol, the only thing I notice that i would question is that I do great as the ISS but there seems to be a considerable amount of negotiation by the V4 controller before the other station takes over as ISS, even when I signal that I wish to be the IRS by sending a "K". This could all be because my QSO partner doesn't have anything typed into his TX buffer ready to send, however. Just mentioning it, in case this "could be" a bit of a issue. That's it. Carry on with the excellent job, Rick!

Could it be RF getting into the mouse cursor? I had to put a toroid on my mouse cable for RMS Express and have had no issues since. Mine was not a jumping cursor. RF knocked my mouse out completely.

Rick,
In retrospect, after reading your comments, I think that the cursor ending up in an area other than the TX window during a QSO is really an operator error as opposed to a fault in the functioning of GUI. It seems that I (and those of us that must keep our eyes on the keyboard when typing) will just have to make certain the cursor is in the TX window when we type.
Thanks for your input on this..

Rick,

I've noticed that when you are typing text to send and you start to
receive text the cursor will move to the top box from the bottom one.
If you aren't paying attention you will continue typing. You then have
to click the bottom box to finish the text you are going to send.

Having been trying to use V4 Chat successfully from the very beginning, I believe V4 Chat has reached a very useful and functional level.

To question the IRS>ISS>IRS " how long the turn-around might take when the link is NOT so decent" is frankly an unfair question or expectation.

This V4 Chat Mode is NOT a perfect communication link...it is not a cell phone connection...it is not a high speed internet connection either. It is a radio communication protocol subject to propagation conditions, sideband interference, signal strength, antenna configurations and operator understanding of how it works.

When the link is "not so decent" is about the same when QSB sucks the life from a S9 +10 signal in the next 10 seconds...you cannot do much about it !!

Hi Rick,

A bit of positive news for your. Just upgraded to V0.6.0.0 and the systems appears to be working very well indeed. I'm using an SB-2000 interface with an M-Audio Delta 44 soundcard driving a Yaesu FT-897 and a Butternut HF9V antenna.

This morning I made my best contact yet getting through to John, VK5PO in Lewiston Australia at 0845UTC (My location is Ringwood UK - IO90CU). I was running 50 watts and John reported a score of 90 with +15dB S/N. John's score with me was 70 with +5dB - those conditions gave near faultless communication. By the end of the QSO conditions had deteriorated and the link struggled when I got down to a score of 46 with the signal at -5dB.

Thanks for all your persistence and hard work to develop V4.

There seems to be more and more life on 14.0730 throughout the day.
Lots of QSB this morning but occasionally hearing those now familiar tones.

1875. Time to spread out a bit?

Yahoo group: V4Protocol
Date: 2011-09-13 12:38:40 UTC
From: k1dow_4
Topic: 1875 Message: 1875

Good morning Rick and all,

Now that activity is picking up considerably on 14.073, I wonder if it isn't time to spread out a bit when the frequency is busy and call CQ (or meet a sked) off the main calling frequency?

Keeping in mind the 200 Hz bandwidth of V4, how far up or down from the main calling frequency would be an appropriate distance to QSY?

I'm also interested in using other frequencies in the bands from 80 through 10 meters. Would 21.073 be a good spot as an example?

Any thoughts on this?

Thanks Ron,

I'll take a look at that but I had a similar setup yesterday and did not see it. It could be an RF issue as someone mentioned.

THis is a good idea and can be done at will now. As long as I could hear it in the rx passband, it should be good.

How about a program mod that allows the system to select a center frequency in "channels" up and down the audio passband of the radio. SO..the GUI allows one to select the "channel" as 0 (14073) +1 (14073.150) +2 (14073.300) and also the -1 and -2 and so on? Not sure what the guard should be but Rick knows that for sure. THe software could also manage to QSY and or scan in that range on its own--even with a ARQ in progress. All possible..significant work to be sure, but we can envision it.

We are kind of wedged in between the PSK at 070 and the jt fols on 076..but that allows a lot of room. I can never figure out where the ALE and amtor stuff is going to be :).

I have gotten a lot of busted QSO's due to other V4 ops.

Anyway, just a thought.

From: Curt Nixon
Topic: 1875 Message: 1880

Hi Ed:

All software...not an expert at programming, but I suspect that this would not be too big a deal since the main program kernel is already there. The GUI for selection might be more difficult than the actual core...except for the automatic part :) Radio wise, nothing to change. just set the dial to 14073 just like now, the software adjusts the afsk to suit. A "discrete, channelized waterfall if you will.

There is some small latitude in the center frequency since I am using Goertzel tone decoders (they don't require a power of 2 samples or integer "bins"). That is what allows tuning +/- 200 Hz. BUT there are many other filters involved that would have to be recalculated and changed with each significant change in center frequency. That is not something I want to even consider.

Also ...something I feel strongly about. This is a narrow band mode... It will work best when there is some selectivity (from the receiver and the built in DSP) AHEAD of all the decoding and the AGC loop. Opening up the receiver bandwidth to show a wider waterfall and allow click to tune or other type "channel" selection via audio defeats the entire purpose of a narrow band mode. It is without any doubt why you hear so many PSK31 operators complaining about adjacent interference (Pactor or otherwise). If you are using a narrow band mode (PSK 31, CW, V4, RTTY etc) then your receiver should have selectivity appropriate to the mode's bandwidth plus some margin for tuning errors, drift etc. If you want a panoramic receiver then you need to look at something like a Flex or other SDR that can show the wide panoramic view but still apply selectivity around the AGC loop...not after detection.

Just made QSO with John myself. It took a while though, signals were marginal both ways so there were lots of retries, but it shows the power of the ARQ mode.

I had to crank my K3 up to 50W, antenna is dipole in attic. Except for WSPR spots I don't think I've been heard in VK before!!

Just a reminder, it was me that came up with the 14073 frequency because it was within "ear shot" of those in that portion of the band using other modes, they would perhaps be drawn to the "new" sounding mode. By all means, if 14073 no longer serves the porpose, move to other sections of the band.

From: Curt Nixon
Topic: 1875 Message: 1887

Well..it was just an idea..

The issue is there are too many people all trying to use the same 200hz segment. often, they may not hear another signal but it will interfere all the same.

It isn't about being able to "see" more spectrum.

That leaves us to move up or down on our own then. No reason we couldn't be using 14072 or 14074 for instance. Like Andy said, if I can hear a V4 signal somewhere in there, I can then answer on that frequency.

Thanks for the short tutorial on the filtering also Rick. Don't ya hate when peple (me) suggest stuff that they have no clue about doing? :)

BTW, I use a quite narrow filter for V4 in the Rx.

If the signal is only 200 Hz wide, then no reason to spread in 1 kHz steps. Use 250 Hz or 300 Hz steps if Tx IMD spreading isn't too bad. Otherwise use 400 Hz. Shouldn't need larger steps with a modern radio...

Hi,

I think it would be a good idea if the center frequency of V4chat could be set around 1000 Hz (or even better user selectable) like other soundcard digital modes, and dare I say for WINMOR too if possible. Reason is that if one has to use USB (not the DATA port of his radio) for his soundcard digital mode operations he could then use his narrow 500 Hz CW filter in order to get rid of adjacent channel interference.

Demetre,

Many digital modes standardize on 1500 Hz. In WL2K all the supported HF modes use center frequencies and most TNC used (PTC II, SCS Tracker, SCS Dragon (P1-P4), KAM and WINMOR) all standardize on 1500 Hz. center audio and USB. A few of the older TNCs have fixed tones and require non standard dial offsets. Those 1500 Hz audio standards make communicating things like center frequency and dial frequency MUCH easier and we have used those for over 15 years. I still remember the total confusion there was when people were using “dial” frequencies and few TNC s were set to the same tones!

Allowing users to arbitrarily pick the audio tones is a lot more work and yields a program that is much harder to maintain, debug and in general will not perform as well since it is difficult to optimize. (e.g. Internal filters are a function of the audio and would have to be all re calculated and implemented. Certainly it can be done but it is not something I have the time and inclination to do because the return and benefits are just not there. Almost any modern radio (certainly all the ones I have had) allow you to move the filter passband far enough to center it near 1500 Hz. You don’t need a 250 Hz filter ....something like 500 Hz is plenty sharp enough and doesn’t have to be tweaked when someone is off frequency a bit.

V4 has the nice functionality of auto tuning +/- 200 Hz and auto tracking a signal (for drift) That is all by design and well optimized. Allowing user selected arbitrary center audio selection is going to incur a lot more work, more confusion to the user and is not going to improve the performance at all. If you want to learn about were the pioneering work in HF protocols is being done read up on the SCS P2- P4 modes and the SCS robust packet mode. I think you’ll find in general they do not support or encourage user adjusted tones and there are good technical reasons for that decision. We can’t approach the performance of these dedicated DSPs with a PC but sticking with standardized tones goes a long way toward similar optimization.

73,

Rick KN6KB

GA Lyle,

I would think steps of about 500 Hz. might be appropriate. It can depend a bit on the ratio of adjacent channel signal strength to desired signal and what effects AGC pumping might have, etc. With 200 Hz or so wide signals spaced at 500 Hz. you have a guard band of at least one signal's width between adjacent signals. That will allow for some drift or some extra sideband garbage being generated and the skirt width of the filters.

I have been able to copy PSK 31 signals where the edges were less than a signal width apart but in those cases the two signals were about equal in strength. I have also been able to copy Olivia 500 Hz wide signals where the edges were only about 100 Hz apart but again the signals were somewhat similar in strength or the adjacent signal was weaker than the desired signal. But you might not be that lucky all the time. A little spacing would be good but 1 KHz spacing is a bit wasteful and over kill.

I don't quite understand why CW nets and some CW operators tend to space themselves out at 1 KHz. intervals. That is almost an open invitation to have someone put something else in between them especially with all the many digital modes available that can fit into that space and still leave a couple of hundred Hz open (guard bands) between their respective signal edges. I would think that most veteran CW ops would have 500, 250 or even 125 Hz filters in their rigs. At least they use to.
Anyway, FWIW.

Guys,
While I don’t want to make the big changes needed for channelized audio tuning via the waterfall I can fairly easily add a mechanism (if one is using radio control) to allow the mouse or keyboard strokes to step tune the transceiver up/down in say 500 Hz steps. This might make it easier to search regions nearby (V4 activity 500 Hz up and 500 Hz down should be visible on the waterfall if one is not using the narrow filter)

Think about it and suggest something that might be useful.

Rick,

First off, I want to complement you on fixing problems that were making it difficult to use V4 with the Flex radios. You've done a very good job and I'm very pleased with V4 performance. I've used V4 with the 5000, 3000 and 1500. Bottom line, works great!

I'm a long time beta tester for FLdigi which allows coupling FLdigi to the radio (using various XML files, depending upon the radio). This is a feature that I find very attractive and use all the time. If you were to include this feature within V4 then I'd be all for it. However, I think (for most users), this isn't necessary. What I'd like to see is for faster through put. Widen the transmit/receive from 200HZ to 500Hz and allow for faster data transfer rates. Maybe have selectable transfer rates. By the way, I do understand the tradeoffs in doing something like this.

In any case, you've done a terrific Job Rick and I, (for one), really appreciate it.

Regards,

Kirk, K6KAR

500Hz seems a bit extravagent to me for a 200Hz wide mode. Olivia 1000 used 1kHz spacing and I never experienced any problems with adjacent channels.

Kirk,
Thanks for the feedback. V4 is settling down and proving to be fairly useful. There is always some room for more tweaking to boost the performance some.

Re changes in bandwidth:
V4 was specifically created to provide a low bandwidth, robust mode that was fairly “slick” (meaning low latency) so one could use keyboard chat type of operation. I am testing a minor change now to speed up the IRS<>ISS changeover to under 2 seconds.

I think what you are asking for in terms of throughput and auto adapting is already in existence. I created WINMOR specifically for file and message transfer (it’s a bit sluggish for keyboard due to its longer frame length (typically 5-7 seconds). WINMOR has two modes, 500 Hz bandwidth and 1600 Hz bandwidth. It is auto adjusting and adjust the modulation modes (4FSK, 4PSK, 8PSK or 16PSK) and FEC coding depending on the quality of the link. The 16PSK mode of course requires a fairly good signal but is fast (9800 bytes/min max @ 1600 Hz and 2400 max bytes/min @ 500 Hz. The other modes are slower but more robust... part of that “no free lunch theorem!”) . The WINMOR protocol adjusts automatically depending on the ACK percentage always trying to optimize the throughput for the current channel. The Program RMS Express allows you to create, edit and send messages (with optional attachments) either through the WL2K radio mail system or to another RMS Express station as a “peer-to-peer” message. If you haven’t tried RMS Express with WINMOR I would suggest it. A download link is available at ftp://autoupdate.winlink.org/User%20Programs/
WINMOR is also available in BPQ32 http://groups.yahoo.com/group/BPQ32/ and in the N3ZH software http://groups.yahoo.com/group/N3ZH_software

If you are a programmer you can incorporate the WINMOR or V4 Virtual TNC’s into your own code using the files and documents in the programmers package. This usually requires writing a driver for the WINMOR or V4 Virtual TNC (similar in effort to writing a driver for a conventional hardware TNC).

Down the road I am thinking about a new auto adapting VHF/UHF (FM) sound card mode that would be optimized for FM radios and reach ARQ throughput in the 30K bytes/minute range (about 4-5 times typical 1200 baud packet but still going through the radios audio ports (not 9600 baud ports). That looks possible based on some very early tests.

Bottom line: It is not really practical to make one protocol do everything for many different channels and applications. But using the virtual TNC concept it is fairly straightforward (I wouldn’t say easy!) to adapt a PC based sound card protocol that is optimized for specific applications and typical radio channels.

1908. V4 Issues

Yahoo group: V4Protocol
Date: 2011-09-14 13:25:43 UTC
From: David Bastress
Topic: 1875 Message: 1908

GM All,

I find it interesting that all the stations can work DX on 20 and 17 meters, etc. using V4 and yet we continue to have difficulty trying to work stations in the 300 to 600 mile range on 40 and 80 meters.

I had a QSO Saturday morning with a station at about 300 miles on 40 meters. While we were able to have a decent QSO there were quite a number of repeat transmissions even though the signals were well above the noise level and at times up to S9. We both were using the version before 6.0.0

Then last evening I had a contact on 80 meters with a station in MN at approximately 500 miles. We each tried a number of times to use the ARQ mode and could not get it work. It didn't seem to want to switch back and worth between stations. ISS>IRS and vice a versa. We kept going back to the FEC mode which did seem to work pretty well under the same conditions. We both were using 6.0.0. Signals last night were not as good as Saturday and there was some QRN.

Since I can't operate much above 30 Meters I haven't had a chance to try it there but there sure seems to be something in the V4 ARQ mode that doesn't do well with the propagation and band conditions encountered on 80 and 40 meters.

Anyway, something to think about.

It's not the V4 setup. look at what prop is saying. We follow VOAAREA daily for phone patching. For the past 10 days or so the lowest recommended freq is 8.9. If that is true then 40 & 80 will be in the suck mode for a while. I enjoy 40 but around here it is dead.

Subject: [V4Protocol] V4 Issues

GM All,

I find it interesting that all the stations can work DX on 20 and 17 meters, etc. using V4 and yet we continue to have difficulty trying to work stations in the 300 to 600 mile range on 40 and 80 meters.

I had a QSO Saturday morning with a station at about 300 miles on 40 meters. While we were able to have a decent QSO there were quite a number of repeat transmissions even though the signals were well above the noise level and at times up to S9. We both were using the version before 6.0.0

Then last evening I had a contact on 80 meters with a station in MN at approximately 500 miles. We each tried a number of times to use the ARQ mode and could not get it work. It didn't seem to want to switch back and worth between stations. ISS>IRS and vice a versa. We kept going back to the FEC mode which did seem to work pretty well under the same conditions. We both were using 6.0.0. Signals last night were not as good as Saturday and there was some QRN.

Since I can't operate much above 30 Meters I haven't had a chance to try it there but there sure seems to be something in the V4 ARQ mode that doesn't do well with the propagation and band conditions encountered on 80 and 40 meters.

Anyway, something to think about.

Dave,

As you know the same transfer mechanism, modulation and FEC coding are used in V4's ARQ mode as in FEC mode. The only difference is ARQ has ACKs and uses the session ID coding.

In general if you can get any copy on FEC mode ARQ will work (though may not be fast depending on repeats). The only additional requirement is that both ends have to meet the latency requirements (< 250 ms measured T>R latency).

One thing that would be helpful to me is to look at the debug log on a marginal (e.g. your close range, lower frequency bands) connection. There is important information in the score of the Constellation, its S/N and the sync "decode distances" that are contained in the V4 TNC debug log. If you have that for the ARQ session you referenced it would be very helpful... Send it to me directly as an attachment (rmuethingATcfl.rr.com) with a pointer to the approximate UTC time of the session so I can find it.

V4 Should be very good for poor multipath channels and it tests well on the HF simulator under CCIR poor multipath conditions. The modulation mode 4FSK was chosen as it is more robust than PSK mode in poor multipath as you would see in short range NVIS or Northern Latitudes propagation.

Perhaps others with short range propagation success or failure could comment on their experience.

Hi- I just joined the group and just installed the V4 software, I think correctly. Did the tests and think all OK. But would like to run through it with someone, verify some of the settings and the maybe arrange a chat.

I have used PSK31, WSPR and JT65-HF modes successfully, but would like to learn this one. My setup is a Yaesu FT-450, Signalink USB interface, Win 7, 64 bit Windows. I have a 6-80M OCF Dipole and an inverted L that will cover 160M.

Tnx and 73

Dave,
No need to edit the log...just say the QSO was between 0100z and 0200z or whatever. You would be amazed at the number of folks that just say “I had a problem”, here is my (2 Mb) log. I usually put those kind of requests in the bit bucket! At any rate I can tell a lot looking at the log details. Sometimes people think things “ping-pong” and timeout but there is nothing queued on EITHER end....that is exactly what is supposed to happen if nothing is queued. At any rate the log tells volumes of what is really going on. Its all in the details and that is what the debug log collects.
73,

Rick

Subject: Re: [V4Protocol] V4 Issues

Rick,

When I get a chance this evening I will send you the logs but you will have to wade through about a half hours worth of logs. When you are trying to have a QSO and things are not going well, you have other priorities than sitting there with a watch in hand and writing down the time every time something doesn't work right! I will cut out the stuff prior to establishing the QSO. As for latency, it varied some but was always between 100 and 200 ms on my end. I can't speak to what the other operator saw.

The basic FEQ coding and decoding worked ok, just couldn't get the transfer done for some reason. It would just sit there and 'ping pong' until it timed out.

Dave K3GAU

Not much info Gus.

Were you the ISS? Were you the IRS? Was this ARQ Mode or FEC mode? Have you setup your transmitter to key correctly (can you send the CWID and Two tone test?)? Where is you log file? Are you connected if in ARQ mode?

Read the help on the procedure for starting and running a simple ARQ mode session.

The same software is working for many others so it is probably something in your setup or operating procedure.

No! If you are calling CQ and someone answers you that is all you need to do other than make sure your machine is answering correctly to the ACKs from the other station. Usually there is a line of print on the receive screen that reads something like "connected to so and so" and you are in business. Just type something out and send it.

Paul, I do recommend reading the help files thoroughly. They are well written and Rick has done a good job with them and the program. Have been working with the program and sending in reports since December of last year, so am somewhat familiar with the program.

Good luck and keep looking for contacts. You will learn something on every connect.

No!
If you are calling CQ and someone answers you that is all you need to do other than make sure your machine is answering correctly to the ACKs from the other station. Usually there is a line of print on the receive screen that reads something like “connected to so and so” and you are in business. Just type something out and send it.

Paul,
I do recommend reading the help files thoroughly. They are well written and Rick has done a good job with them and the program. Have been working with the program and sending in reports since December of last year, so am somewhat familiar with the program.

Good
luck and keep looking for contacts. You will learn something on every connect.

Ray - for some reason I was never
connected. So here is what I should do?
- Call CQ
- Someone responds, I go to ARQ tab and type their call in the Call CQ box and send
- Does the software "connect us" and I should see "connected
" in the soundcard window? Never got that far but will try again.

1930. Operating from abroad?

Yahoo group: V4Protocol
Date: 2011-09-15 18:09:02 UTC
From: SV1UY
Topic: 1930 Message: 1930

Hi Rick,

What happens when we operate from abroad? I am going to the UK on Monday for 2 weeks and I will have my radios with me. I intend to operate as M/SV1UY but V4 cannot accept this as a valid callsign.

OK I can always operate as SV1UY and this is what I am going to do and inform my QSO partner that I am M/SV1UY when I have a chat, the same way I do when I operate Pactor, or PACKET Radio.

73 de Demetre SV1UY

P.S. I still think it is best if we move the center frequency of V4 in 1000 HZ from 1500 HZ because that way we can take advantage of our 500 HZ narrow CW filter when we are on USB. Some radios do not allow you to use USB on DIGITAL MODES. Perhaps allowing the user to make his own choice is a bad idea, but I think that 1000 HZ is the best choice.

From: Paul Leger
Topic: 1930 Message: 1931

Demetre does have a point in the 1000hz over 1500hz for the centre frequency. My system is setup for the 1000 hz centre point with my filters. However I also understand the other side of it.

From: Rick Muething
Topic: 1930 Message: 1933

Demetre,

The syntax checkers for call signs accurately check all Amateur and MARS call signs. They don't accept any or all of the "stuff" we sometimes add on for ID like KN6KB/4 or XE2KN6KB or KN6KB/MM etc...those don' t have any agreed syntax so are next to impossible to check and accept. Plus the connect request frame must contain both call signs and that just allows two 7 character call signs Plus optional –ssid (those are encoded a special way to fit into a total of 16 ASCII characters.

Virtually all TNCs have limits on the "MYCALL" and in fact many won't even accept 7 character call signs (e.g. Packet).

For foreign or portable operation I would just suggest signing in the text the legal ID such as SV1UR / MM in the text at the end.

From: Rick Westerfield
Topic: 1922 Message: 1935

I connected to you today at lunch and some characters from you made it to my machine but mostly not. I had a V4 Chat with W3BI immediately after my attempt with you on the same frequency and all went well. That qso lasted maybe 15 minutes with little trouble.

I had a very strong signal from your station when attempting with you. So I am guessing that you might be getting RF into your lines or sound card.

What is your interface? I use a Signalink USB that works very well.

Do you have a resonant antenna for 20 meters? A beam is certainly not required but using an antenna tuner to assist with using a non resonant antenna gives me lots of trouble.

I also use a signalink. This setup works well with every digital format that I have tried save this one. Even earlier versions of V4Chat (0.4) have worked. I doubt that RF in the sound card is the problem. Don't think that I would connect if it were. Maybe I am wrong.

Nothing left the OB. I sat waiting for it to empty but then we timed out. I use a Cushcraft A3 for 10,15,and 20M. All are resonant with good vswr (no tuner required). FEC mode will transmit and dump the OB just not ARQ. Anybody got any ideas?

Have you done a latency test? If you are lagging, then it'll be hard to receive an ARQ or ACK (or whatever).

This appears to be something I have seen as well. QSO starts OK and 3 or 4 lines are sent and received, but the next line won't go into the output buffer and eventually I am disconnected due to time out.

Ron/All,

If you think there is a real problem in the software or see something strange during a session use the debug log. It contains far more and important details to the trained observer. Send the V4 TNC debug log to me as an attachment. Note the approximate Time UTC the problem was observed. I will take a look and usually can tell exactly what the issues is but sometimes need to see the debug log of the other side of the session.

Try setting Signalink delay to zero and give V4 Chat enough audio to bring the receive indicator to mid scale or more.

First successful QSO with AA1CZ. T/R latency was at 170ms on screen for past attempts turned the signalink delay down all the way (T/R latency 17ms on screen) and things are now working, even at full power.

Thanks for the QSO Al.

Thanks Rick for the advice,

Ron

Hi Julian,

I noticed that same effect when I thought I'd play it smart and use my dummy load to test latency.
My noise level was next to nothing and latency was up around 400 - 500 ms. When my noise level
is higher when attached to an antenna (S7-S9) my latency is down around 60 to 80 ms. The average
S level here is around S5. My latency then is around 100 ms.

Fred/All,

We'll make no progress on fixing this until I can see the debug log. I know I sound like a broken record but that is the ONLY practical way we have now of dealing with the hundreds of details going on inside the protocol.

If you have a problem:
1) Note the approximate time UTC that it was observed. The closer you can pin this down the less "wading" I have to do through your logs.
2) Describe the problem as to what was observed. E.g. No outbound queue value after typing etc.
3) Send me the log as an attachment to rmuethingATcfl.rr.com. Don't cut and paste into a email just attach the log.

OK here is my update the thread I guess I started with answers to several questions.
- I was in ARQ mode
- I have NOW read all the help files
- I do know which block to put my outgoing text
- I use a Signalink USB interface, Z-11Pro auto tuner, My antenna has a good SWR on 20M. (The rig has worked fine on PSK31, WSPR and JT65-HF)
- The latency on V4 varies from 7-56
- My status showed as Connected, but when I hit send, the text wouldn't go out (I did not at the time notice if it went to the buffer or what the buffer number was.) But people were saying you have to send something before it times out and I was trying, it wouldn't go.

Thanks for all the replies
Paul

Topic: 1922 Message: 1948

All,

As described in the help. The latency measurement measures the time in ms from the release of the PTT until the receiver has audio. So it must have some audio to measure and this comes from the background noise. (Normally when your transmitter is keyed there is virtually no receiver audio output). To get this background noise requires:
1) Having your AGC on (generally fast is best). This boosts the background to a standard audio level
2) Some backround RF noise...NEVER a problem on HF when you have an antenna connected. If you have no antenna or a dummy load there may not be sufficient noise to trigger the measurement.

The measurement doesn’t do ANYTHING with the measured results ...it just displays them primarily for the purpose of helping to correctly setting up your keying (e.g. making you aware your SignaLink DLY value is set above minimum etc) There is a 1000 ms bailout and the measurement should never be that long unless you have no noise or the SignaLink DLY way up there.

If you can’t get a measurement due to no background you can tune to a signal or even a built in calibrator output and try to make the measurement again. It is just receive level that tells the measurement the receiver has recovered from release of the PTT.

If your latency is truly too long what will happen is you will never hear and decode an ACK. If you call a station and get a connection notice it is probably fine since you received the ACK.

On most items the help file has an index and using it will locate the key word and the page or pages that cover it.

But Paul....where is your debug log? That will tell me everything and not waste peoples time speculating.

For example:
You did not say whether you were the IRS or the ISS when it wouldn't update the Outbound buffer.
You did not say whether the other station was sending IDL's (if you were the IRS)

All this and much much more is in the debug log. Send it to me with the approximate time and a description of the problem and I'll either fix it or tell you what was happening .

1951. Special Test version....0.6.0.1 PLEASE READ CAREFULLY

Yahoo group: V4Protocol
Date: 2011-09-16 17:50:47 UTC
From: kn6kb
Topic: 1951 Message: 1951

I have uploaded a new test version. This is not released and I need some feedback on it. If you are new, just getting started or expect bulletproof code DON'T TRY THIS version

Since this is a test version I did NOT put it on auto upeate. You must do a complete uninstall reinstall to try this out.

New features in test:

Now Right mouse click on Keyboard or Session text windows will bring up sub menu allowing Cut, copy, paste or clear all (no paste on Session text). The shortcut keys (e.g. Ctrl+C etc) will also work and are listed on the pop ups.

If you add a contact using the mini log it will default the call sign entry to the current (or the last if not connected) call sign.

IF you are using radio control:
I have verified these on at least one Kenwood and one Flex radio. It should work for those models.

If you change the radio frequency using the radio control via the mini log or you manually retune the radio the frequency shold display where it says "waterfall" on the V4 TNC menu.

If you see a V4 session in the waterfall but not on frequency if you click on the center of the signal in the waterfall it should retune the radio placing it in the center of the waterfall.

This will not yet work for other radios but it should make a necessary log entry for Icom radios in the MAIN v4 LOG (not the V4 TNC debug log). I need to see that log and I think I can get the Icom to work.

All other functionality of this test version should be the same as 0.6.0.0

I could use some feedback on:
1) Is this helpful in terms of how you would use the V4 Chat software?
2) If you have an Icom or Flex radio and are using radio control did it set the frequency correctly and update the V4 TNC frequency display?
3) If you have an Icom amateur radio (not NMEA) did you get a log entry (Main V4 Log) saying something like:[RadioResponse] Icom reply:... If so I need to see that log and what your Icom model was.

Thanks,

Rick KN6KB

Fred/RIck. I could add: If hooked for Ctrl Cr, so remember use the corresponding action. XP home. My first try on this SW. Working well. I have debug logs, but so far not necessary sending I think. My latency from 30ms to 50ms. Signalink USB.

Fred, you obviously did that correct, and I as well...by some luck.

Good use of Bold for RX and Italics and different colours for TX Rick.
Should work well for coulour disabled hams.

One minor issue, might be mentioned, and needs later systematic tests and timing compaired with the debug logs: That is some times one letter dissapears in the beginning of a word when text is moved to upper window.

I did not notice before checking scroll windows after the qso.

I actually also did some typos, so did not notice real time.

This maybe is just a trade off due to "slickness" in changeover, as protocoll by memory is not intended being as bulletproof as WINMOR. So maybe the counter station also did not get that missing letter.

I would guess that maybe a "weak point" is all the idle changeovers if the counterstation did not yet enter the Ctrl Cr.

Bottom line as seen by a newbie:
Good work Rick. Interesting mode. Congratulations!

Hi Rick.

Up till the last few days I've not had any problems with software.

The only station I was not able to QSO with was F1SMC Eric

All the rest have been fine in total 14 QSO's. So I think

Eric may have a latency problem.

Thanks for a great program

From: Michael
Topic: 1922 Message: 1954

Rick,

With latency, I did notice one unusual thing. I'm running a Flex-3000, set up as per the help file. I get latencies of around 125 or so. I noticed that I didn't have a lot of RX signal, so I bumped up the output from the flex to the decoder. Testing latency again showed it to go up into the 500's range, which really puzzled me. The only thing I changed was the signal level. I pulled the signal level back down to just a bit above the green bar and the latency dropped also, back into the 125 range. Nothing else was changed. Kinda weird.

Excellent improvement for me regarding the pop up command menu in the system windows, Rick. The logging feature is working fine, too. Since I use manual control of my FT-840, I can't comment on any rig control features, but all that applies to my use of the program here is working just fine.

Rick,

I have a Kenwood TS-590 and it looks like everything mentioned is working, even clicking on the waterfall. Having the text move up in the upper box and text in the lower box that's faded is very handy to keep track of the QSO and text that is sent. It looks great.

Thanks Ron,

I think it is OK for the Flex and the Kenwoods but I still need to get the frequency read back code working for the Icoms, Yaesu and others. Of course none are the same and even some are different from the same manufacturer.

If I can capture the Icom reply in the V4 Chat<date>.log the Icom should be fairly easy.

73,

Rick KN6KB

Hi Rick,

New version is working OK with my Icom 7000 except:

Adjusting the radio tuning knob does not update the frequency on TNC window below the waterfall. It looks like the CIV data from radio to V4 is not being decoded/displayed.
It is being received according to the log file (attached).

And my responses to your queries.

1) Helpful. Somewhat. I already use the log with a bunch of frequencies entered and click on them to move around.

2) No it does not. See above and attached log files. (My Icom CIV works correctly both ways with FlDigi, Digipan, MixW etc.

3) The radio replies in Icom CIV format look fine.

Operating practices evolve. And ARQ on HF (since spread spectrum is not allowed) really can’t have two sessions going on the same frequency at the same time. I would guess that V4 Operation would be in some clusters say a couple of KHz wide where you could fit 4-8 connections. Then the click on a waveform of the waterfall makes it easy to monitor and/or connect to a station. Note you still want to probably use the built in DSP 400 Hz filter (that still works on 0.6.0.1 exactly as before but the waterfall display is “pre” filter so you don’t see the filter effects as before. That was necessary to allow you to see the other adjacent sessions.

You really have to see how it evolves. Remember PSK 31 is now about 12 or 13 years old I think.

Hello Rick
I can not get the cat function to work
Rig is icom 765
Keying via com 1 and opto works fine
Cat-control via com 6 does not ...
How should the icom address be filled in??? The 765 has default 2C or 44 ...
so should I fill in 2c or 44 in the address field?
If everything else fails I would make a contact to you via teamviewer and
you can "have my rig" virtually for testing

Topic: 1951 Message: 1972

Siegfried,
With any Icom the address selected in the setup must match the address set up in the radio. The help files show the default values for most Icom radios but you may have changed yours to some other value (usually a menu setting on the radio). Remember the radio address is in hex and is entered in the Radio control setup of V4Chat as a 2 digit hex number e.g. “04” or “E3” etc. The numbers aren’t critical but they MUST match the settings in the radio.

The readback part of the code in version 0.6.0.1 is incomplete but the set code should work for the 765.

Topic: 1973 Message: 1973

Hi Rick,

Feedback re: Test Version v0.6.0.1

Setup:

Icom IC-736 ("Early" Icom)

CIV Control Address Hex 40 9600Bd

USB to RS232 Converter COM4

RS232 CAT Controller powered via DTR

Separate PTT TX Line using RTS

"Old" Pentium 4 2.66GHz 2GB RAM

GeForce FX5200 256MB

XP Pro 32 Bit

Crystal Fusion CS4281 PCI Sound Card for System Sounds

SoundBlaster Live PCI Sound Card for Radio

Setup works fine with HRD, Digital Master, JT65, Winmor, etc

Have had a few successful V4 contacts in the past

--- In V4Protocol@yahoogroups.com, "kn6kb" <rmuething@...> wrote:

> Now Right mouse click on Keyboard or Session text windows will bring up
sub menu allowing Cut, copy, paste or clear all (no paste on Session text).
The shortcut keys (e.g. Ctrl+C etc) will also work and are listed on the pop
ups.

All work as expected

> If you add a contact using the mini log it will default the call sign
entry to the current (or the last if not connected) call sign.

Works as expected

> If you change the radio frequency using the radio control via the mini log
the frequency should display where it says "waterfall" on the V4 TNC menu.

Works as expected

If you manually retune the radio the frequency should display where it says "waterfall" on the V4 TNC menu.

Does not work, frequency remains as last set

> If you see a V4 session in the waterfall but not on frequency if you click on the center of the signal in the waterfall it should retune the radio placing it in the center of the waterfall.

Works as expected

> This will not yet work for other radios but it should make a necessary log entry for Icom radios in the MAIN v4 LOG (not the V4 TNC debug log). I need to see that log and I think I can get the Icom to work.

> I could use some feedback on:

> 1) Is this helpful in terms of how you would use the V4 Chat software?

Certainly V4 Chat is becoming more intuitive with each new release. Clicking the Waterfall to change freq is obviously extremely useful! Off Topic Wishes:

Mouse Wheel to Control Frequency whilst hovering over Waterfall?

User Defined Folder to store Logs, etc.

> 2) If you have an Icom or Flex radio and are using radio control did it set the frequency correctly and update the V4 TNC frequency display?

As shown above, outgoing Control works, and frequency is correctly updated during these. However, V4 is not picking up the new frequency as the frequency is changed manually on the Icom. I know data are coming in from the Radio via the COM Port whilst retuning as I have TX/RX LEDs on the USB/RS232 Converter.

> 3) If you have an Icom amateur radio (not NMEA) did you get a log entry (Main V4 Log) saying something like:[RadioResponse] Icom reply:... If so I need to see that log and what your Icom model was.

There are "Radio Response entries in the Log. Will send the two Log Files.

Sorry, Off Topic, I'll repost if needed with more details:

Back in July I could always get a Latency of between 10mS and 100mS, but with later versions (from v 5.1.0), I get no Latency reading, with the usual Log of "Insufficient Background Noise or RX Latency >1000mS".

I have checked the usual "suspects":

Background Noise is well into the green (I have tried varying the Input Level throughout the green range)

No other Applications running on the PC

TNC CPU Usage never exceeds 36%

Squelch set at 5 (I've tried a range of 3 to 6 on Squelch)

AGC is set to "Fast" on the Icom.

However, I've had several successful V4 contacts and all seems to be operating correctly - the ARQ change-over 'feels' and sounds OK.

Hi Rick,

I just downloaded 0.6.0.1. All appears fine. I didn't do it yesterday because this pc and the one I use for V4 are on
separate floors. I use this one for email and the one in the cellar for radio stuff. The rig is an FT-920 and the radio
CAT control works if I click on the waterfall but changing radio frequency manually does nothing. Having the
frequency shown below the waterfall is handy. I noticed that clicking on the waterfall, the frequency the radio is set to
is 10 Hz low. Just a point of interest. I've sent the Debug log file along to your email address. You'll notice I played with
clicking the waterfall.

You've put a lot of work into this. Thanks.

Thanks Ron,

I think it is OK for the Flex and the Kenwoods but I still need to get the frequency read back code working for the Icoms, Yaesu and others. Of course none are the same and even some are different from the same manufacturer.

If I can capture the Icom reply in the V4 Chat<date>.log the Icom should be fairly easy.

73,

Rick KN6KB

Fred,
The code for the Yaesu frequency read back is not in there yet. It is tricky since there are so many models and many different formats used. (so much for standarization!) The click on frequency tuning has a resolution of about 5.9 Hz per pixel so unless you are exactly on center it is easy to be a 10 or more Hz off the frequency. However the normal auto tune (default is +/-100 Hz) should easily capture the signal so it is not critical to get it exact...just close. Also note that depending on the radio it may not resolve the frequency to the nearest Hz which is what is sent to the radio.

Topic: 1978 Message: 1979

Rick,

Interesting thing happened after I had a qso with KC2NYU this morning. I answered KC2NYU's CQ with his callsign entered in the call field. We were finishing the QSO and I think he ended it. My station started to call his station requesting a connect. I kept aborting it but it kept calling him. I am sending you the logs. It was around 1300 UTC.

Thanks,

Ron ny3j

There is nothing in the V4 protocol or V4 Chat that is intended to support unattended operation. If you need unattended operation (the ability to initiate a connection, accept a connection, send/receive a message/text while unattended) then you should be using a message protocol like Pactor, or WINMOR. V4 Chat is intended for manned keyboard to keyboard chats or the manned transmission of prepared text file.

Beaconing can dramatically increase QRM and is not used by most HF BBS stations and there are no plans to add it to V4Chat or the V4 TNC.

Rich and Fred,

Thanks for the feedback. I knew KC2NYU signed. He probably clicked the end tab and that's when my station tried to connect again with him. It wouldn't stop even when I hit abort. I also remember when I cleared his call from the ARQ call field my station stopped calling him. The computer was taking over :-) Rick has the logs.

Topic: 1987 Message: 1994

You don’t NEED a registration key to run the software...If you are unregistered and you start the program it just pops up the “nag” reminding you that registration would be nice and is one way we support all the real costs of developing and maintaining the software, third party licenses, and running the systems it runs on and supports.

Now those participating in the beta program (before we get to rev 1.0.0.0...probably in the next month or so) will get a free registration when they complete a minimum number of V4 ARQ connects. That is a thank you for helping with the testing and feedback. After 1.0.0.0 the ARSFI (Amateur Radio Safety Foundation Inc) registration site will be operational and a donation (probably $25) will get you a registration number that will work for one call sign and any –ssid of that call sign. The registration key can be used on any number of computers or instances without restriction.

Again the program does NOT REQUIRE registration to run and there is no time limit or crippling of program functions if unregistered. It is basically a similar mechanism as WINMOR. Note however that V4 and WINMOR registration keys are NOT the same and NOT interchangeable.

Yes! It was very nice to see it working! Unfortunately, here was a lot of QRM and I lost connection a few times...

I will try a few more times....

2000. Re: [V4Protocol] Marrying V4 Chat and RMS Express

Yahoo group: V4Protocol
Date: 2011-09-18 18:44:06 UTC
From: Rick Muething
Topic: 1996 Message: 2000

Andy,
Yes I know it is possible but I don't really understand how or why it would be used. The main difference is RMS Express is a message client. It sends prepared messages (with optional attachments) via any of several protocols (Telnet, Packet, Pactor, WINMOR, Robust Packet) either to a WL2K server or to another RMS in peer to peer mode. But V4 is intended to be a narrow band keyboard chat mechanism that is fast enough to support a reasonably decent typist (about 40 WPM) in a live (attended) connection. But there is nothing in the WINMOR or V4 code that won't allow both RMS Express and V4 chat to be both open at the same time AS LONG AS BOTH DON'T TRY TO KEY AT THE SAME TIME!

Perhaps down the road if there were a lot of demand we could add a chat mode to RMS Express but it really is a different usage and I think in the end could be confusing to users. To me anyway that seems something like running Skype and Outlook express at the same time...yes its possible but is that a reason to combine the two programs?

The RMS Trimode server (which a few of us are testing) does operate in three modes all at the same time. At least it listens for connections simultaneously on Pactor (1,2,3,) Robust Packet, and WINMOR. Once a connection is made the other modes are disabled. That requires some simple electrical mixing of the audio from three TNCs (PTC II, SCS Tracker, WINMOR) but it is not difficult and works well. The goal with this is to allow fewer RMS stations to support more users by being able to operate multi mode.

Yahoo group: V4Protocol
Date: 2011-09-19 08:36:28 UTC
From: Bob Thornton
Topic: 1978 Message: 2006

There is currently some scope for it to happen without intent. After calling CQ with no response yesterday I left my rig on for a couple of hours unattended to monitor activity. On returning much later I found that I had received connect requests about 90 minutes after my CQ. Fortunately (and probably unusually!) I had thought to switch to FEC mode before I left. Otherwise there would have been a couple of minutes of connection and a "failed" QSO to potentially be reported by the other party. So would it be better to have responded with a "beacon text" and quick termination, or should the software automatically revert to FEC mode after a period of keyboard inactivity? I suspect the latter is necessary.

Bill,

When you make a call to another station (or even a CQ) you need to have a specially formatted frame with the callers call sign and the target call sign in a special format. That is what the Call button and popup menu do. A simple “CR” would not know what or how to format.

2013. Latency measurements - Yaesu FT-847.

Yahoo group: V4Protocol
Date: 2011-09-19 20:45:21 UTC
From: G4AIU
Topic: 2005 Message: 2013

Hi Rick,

I am checking out V4Chat 0.6.0.0 - CQ calls only at the moment but no QSO's yet!

What I am finding so far is that my latency measurements on the CQ calls are either 31ms or 47ms. It does not matter what frequency I transmit on, be it HF or VHF - it appears to always be either one of these two measurements.

This is my first venture into any ARQ/FEC type mode and thoroughly enjoying it.

Many thanks for your hard work involved in this project - I admire your skills. I am looking forward to the rig control for my two Yeasu rigs - FT-847 and the FT-857D.

Eugene,
That is fine. There is normal granularity and variance in the latency measurement caused by the timer resolution and OS latency. Anything under 250 ms is fine.

If I load HamRadioDeluxe and DM780 first, then I can load FLdigi, and then V$chat.. Except that I have never successfully gotten V$chat going in ARQ (nor have I done things like forward a log...which I will do). I suspect that the ability to do that depends on the sound card used. When I copy text from DM780 to FLdigi, or the other way around, all the zeros are changed to "x"'s.

FLdigi is a sound card hog, and if I load that first, it will not relinquish control of the sound card.

2020. V4Chat 0.6.1.0 Uploaded to FTP and Auto Update servers

Yahoo group: V4Protocol
Date: 2011-09-20 20:34:51 UTC
From: kn6kb
Topic: 2020 Message: 2020

All,
Thanks to the many that have contributed to the changes and enhancements in this version. It should now work for radio types Kenwood, Icom, Flex and Elecraft. The control should work for Yaesu but not the read back (that is messy since there are many different models and formats).

Click to tune should work for the above radios as wellas auto readback from the receiver dial.

I have posted this on the auto update server and your old version (0.5.2.0 or later)should auto update. If it doesn't try restarting the program and waiting for 2-3 minutes to see if auto update does not start.

You can also download the full install from the Yahoo FTP and remove/re install as before.

As usual please be specific with comments and observed problems. Be sure and include your radio model if the issue has to do with frequency setting or read back.

There are several small but important changes/additions in the Help.

Good luck... We're moving ahead. My plan is to have a full production release by the end of the year.

73,
Rick KN6KB

V4 Chat Revision History

Date: Rev Change Summary

Sept 20, 2011 0.6.1.0 Beta release of 0.6.0.7 Help updated.

Sept 20, 2011 0.6.0.7 Fixed problme with Icom read back formatting in Radio.RadioResponse
Modifide UpdateSessionDisplay to put all plain black (info) text on separate line.

Sept 19, 2011 0.6.0.6 Add Me.Focus at end of startup to insure Main V4Chat form has focus.

Sept 19, 2011 0.6.0.5 Modified Radio.OnRadioResponse to handle incomplete streams.
Modified rtbSession to eliminate extra LF on plain black text

Sept 18, 2011 0.6.0.4 Fixed potential problem with RadioResponse routine for both Icom and Kenwood.

Sept 18, 2011 0.6.0.3 Fixed a problem with Kenwood and K3 Frequency Readback for certain conditions.

Sept 18, 2011 0.6.0.2 Fixed Frequency Readback in Radio for K3, Icom amateur, Icom 7200 and Icom Early radios.
Modified Radio and V4Chat.Main to remove all 1500 Hz offsets

Added code to clear blnARQCalling whenever btnCall was enabled.
Updated Help

Sept 12, 2011 0.6.0.1 Added context menus for RtbSend and RtbSession to allow Cut, Copy, Paste, and
Clear All via right mouse click.
Capture Current Connected call in strConnectedCallSign and Enter into Mini log grid upon right click of blank line.
Implement Frequency Reporting and Click to tune if using Radio control
Changes in GetFrequency added to Radio, Modify tmrPoll to poll radio every 500 ms.

V4 TNC Revision History

Date Rev # Summary ofChanges

Sept 20, 2011 0.6.1.0 Beta Release of 0.6.0.3

Sept 19, 2011 0.6.0.3 Modify Protocol.ProcessARQ frame to not pass duplicate FEC data frame if not connected.

Sept 15, 2011 0.6.0.2 Modify busy detector to reduce sensitivity slighty. Thresholds:
Narrow was 6 + Squelch
now 7 + squelch; Wide was Squelch/3 now Squelch/2.5
Modify ThreshDetect to change exponent of Squelch was 2.0, now 1.8 (more sensitive)
Modify latency measurement trigger threshold from 2:1 to 1.5:1

Sept 14,2011 0.6.0.1 Shorten intIDLCycle to 1500 ms (was 2500) [shortens link turnover]
Optimize delay calculation for staggering dual IDL repeats in ProcessIDLs
Shorten base leader length to 8 symbols (was 12) ~5% throughput improvement in ARQ
Correct leader length calc in V4Mod.New
Added creation of Read Only V4 TNC.ini backup upon successful registration.
Add Commands DISPLAY and TUNE to facilitate freq display and click waterfall to tune
Remove display of filtered data from waterfall. Filter functionality unchanged.

Hi Paul

So it was you, was it? Thanks for the call. Unfortunately your signal
was right down in the noise, so couldn't decode.

I will be on 20m some during the day tomorrow.

Ron,
Auto update has been verified on both FTP (pre 0.6.0.0 versions) and HTTP (post 0.6.0.0 versions). You must have port 8776 (HTTP) or port 8777 enabled for auto update to work.

2028. 0.6.0.1 with TS-590S

Yahoo group: V4Protocol
Date: 2011-09-20 22:04:03 UTC
From: Ian Wade G3NRW
Topic: 2028 Message: 2028

Hi Rick

Just started trying 0.6.0.1 -- the first time I have tried V4 since 0.1.something.

I have found that the Kenwood TS-590S does not track with the program properly. A number of observations:

1. V4 sends out FA; at about 1 second intervals. The radio responds with the VFO-A frequency, but for some reason only during transmission. The radio does not respond to the command when it is receiving. (It does with other digital programs -- I don't understand why the response to V4 is different).

2. The VFO frequency that replaces the Waterfall label is not always correct. For example, if the VFO is at 10.13100, it sometimes appears as 101.310, 0.00101, and similar right/left-shifted values.

3. In any case, when the VFO frequency is 10.13100, the waterfall frequency should be shown as 10.131500 -- that is 10.13100 + 500 Hz center frequency offset. You need to add 500Hz to the VFO frequency.

4. The program assumes you are using VFO-A. It would be much better to find out which VFO is in use first, with FR; Then you can send the correct FA/FB command.

5. At the moment I am relying on data VOX to turn on the transmitter. It would be better to give the option of selecting the TX1; CAT command to transmit, and RX; to return to receive (as in fldigi). Then you are not encumbered by VOX delays.

Ooops, this looked wrong when I wrote it:

>3. In any case, when the VFO frequency is 10.13100, the waterfall
>frequency should be shown as 10.131500 -- that is 10.13100 + 500 Hz
>center frequency offset. You need to add 500Hz to the VFO frequency.
>

I should have said "add 1500Hz to the dial frequency", not 500Hz.

Rick,

Brief observations following upgrade V0.6.1.0.

1. My FT847 completed the Auto upgrade without any difficulty using PORT 8776. As indicated the computer-to-rig frequency changes are working without any problems. The centre RED marker on the TNC screen indicates a frequency of eg. 14073.000 when I mouse-click on the CQ contact screen. I get a reading of 14073.305 when I mouse-click on the Right hand GREEN line. When I click on the Left hand GREEN line - I get a reading of 14072.994. However, when I click again on the centre RED line I get a reading of 14072.689. These frequency changes are indicated on the rig as 14073.300 and 14072.690. I was expecting to tune to the centre line again, 14073.000 but when I mouse click on the RED line I get a reading on 14072.689. Hope all this makes sense to you!
2. My FT857D also downloaded the Auto update using PORT 8776 and the frequency of 14073.00 is displayed on the TNC screen. However, I previously downloaded V 0.6.0.1 onto the associated computer but the Header on the V4Chat and the TNC screens still reads V0.6.0.1 and not V0.6.1.0 as expected. The frequency display on the TNC screen is as follows: The RIGHT hand Green line indicates 14073.30 and the LEFT hand Green line reads 14072.70. The rig reads 14073.30 and 14072.70 respectively. When I click on the centre RED line the frequency does not move from 14072.70 - the same frequency as the LEFT hand Green line.

Hope this helps in some way. It is now midnight and I am going to bed!!

The tune on click is working fine. Verified on three different radios. If you click on the Center (red line) it request a change of 0. If you click left of center it will bring the point clicked on (spectrum) to the center by tuning the radio down (raising the audio frequency). Its really simple: If you see a signal click on the center of the signal and it will bring it to the center of the waterfall. Auto tuning should capture within the range you have in your setup. The click range on the waterfall is only +/- 700 Hz but if you repeat the click it will keep moving the radio.

When I click on the centre RED line the frequency does not move from 14072.70 – the same frequency as the LEFT hand Green line.

Hope this helps in some way. It is now midnight and I am going to bed!!

Ron,

Auto update has been verified on both FTP (pre 0.6.0.0 versions) and HTTP (post 0.6.0.0 versions). You must have port 8776 (HTTP) or port 8777 enabled for auto update to work.

From: Rick Muething
Topic: 43 Message: 2041

All,

A number have had success with auto update and a few no success. Your software is the same! For auto update to work you MUST:
1) Have at least version 0.5.2.0 or later
2) Have the outbound connection ports opened in your router or firewall. How you do this is a function of YOUR router or firewall program and settings. Some will ask if you want to create a permanent rule etc. Versions prior to 0.6.0.0 will be trying on FTP port 8777. Later versions will use HTTP on port 8776. HTTP has some advantages being a little faster and less likely to cause problem with aggressive firewalls/routers trying to block a return FTP connection. If you autodupdate log shows something like the downloaded file list was empty then then most likely the port is not enabled.

If you have an exception re a license problem for IPWorks you may have deleted or failed to do a full install. Since other are not having this problem I don’t think the problem is in the basic installation. Try downloading version 0.6.1.0 and installing and it should have the proper IP works license info in the install.

Ian,
Use version 0.6.1.0 all others are obsolete. I have verified correct operation on a TS-2000, Flex 3000 and Icom 7200. It reads the VFO back and displays once per second as designed. You should have the baud rate up at 4800 or above

The tune on click is working fine. Verified on three different radios. If you click on the Center (red line) it request a change of 0. If you click left of center it will bring the point clicked on (spectrum) to the center by tuning the radio down (raising the audio frequency). Its really simple: If you see a signal click on the center of the signal and it will bring it to the center of the waterfall. Auto tuning should capture within the range you have in your setup. The click range on the waterfall is only +/- 700 Hz but if you repeat the click it will keep moving the radio.

Subject: RE: [V4Protocol] New file uploaded to V4Protocol

Rick,

Brief observations following upgrade V0.6.1.0.

1. My FT847 completed the Auto upgrade without any difficulty using PORT 8776. As indicated the computer-to-rig frequency changes are working without any problems. The centre RED marker on the TNC screen indicates a frequency of eg. 14073.000 when I mouse-click on the CQ contact screen. I get a reading of 14073.305 when I mouse-click on the Right hand GREEN line. When I click on the Left hand GREEN line - I get a reading of 14072.994. However, when I click again on the centre RED line I get a reading of 14072.689. These frequency changes are indicated on the rig as 14073.300 and 14072.690. I was expecting to tune to the centre line again, 14073.000 but when I mouse click on the RED line I get a reading on 14072.689. Hope all this makes sense to you!
2. My FT857D also downloaded the Auto update using PORT 8776 and the frequency of 14073.00 is displayed on the TNC screen. However, I previously downloaded V 0.6.0.1 onto the associated computer but the Header on the V4Chat and the TNC screens still reads V0.6.0.1 and not V0.6.1.0 as expected. The frequency display on the TNC screen is as follows: The RIGHT hand Green line indicates 14073.30 and the LEFT hand Green line reads 14072.70. The rig reads 14073.30 and 14072.70 respectively. When I click on the centre RED line the frequency does not move from 14072.70 – the same frequency as the LEFT hand Green line.

Hope this helps in some way. It is now midnight and I am going to bed!!

2048. 0.6.1.0 with TS-590S

Yahoo group: V4Protocol
Date: 2011-09-21 07:27:00 UTC
From: Ian Wade G3NRW
Topic: 2048 Message: 2048

Hello again Rick

I have now installed 0.6.1.0, and it works much better with the TS-590S. VFO tracking is now OK.

But you still have an initialization issue. I see that you now force the radio to VFO-A and initialize various other parameters (BC0;NB0;NR0;FR0;FT0;RC;MD2;). That's fine, except you don't do this until V4 transmits for the very first time. Until that point, you simply request the VFO-A frequency with FA; which doesn't help if you happen to be using VFO-B. I think you should do the full radio initialization right at the start.

Two other outstanding points:
~~~
~~~

2049. Re: [V4Protocol] 0.6.1.0 with TS-590S

Yahoo group: V4Protocol
Date: 2011-09-21 11:26:45 UTC
From: Rick Muething
Topic: 2048 Message: 2049

Thanks Ian,

Some good inputs.

There should be a mode initialization stuck in before the actual first transmission.

Actually the TS-590 and the TS-480 already have the option of TX0 or TX1 allowing you to key the radio via the CAT control and select either the Mic input or the (auxiliary) input. In the Radio setup menu after you have selected Kenwood radio type and selected the appropriate com port for control the PTT Port will have several options:

1) External will use external PTT keying e.g. From a SignaLink PTT output
2) Selecting another serial port will use direct PTT keying using RTS and/or DTR signals from that serial port.
3) K590-Mic will key the TS-590 using the TX0 command for PTT on and RX for PTT off
4) K590-Aux will key the TS-590 using the TX1 command for PTT on and RX for PTT off.

That was done that way to allow flexibility in the selection of the audio source. Since I don’t have a TS-590 here and didn’t see it in the Kenwood documentation I am not sure if the TX1 command actually takes the data from the Aux port or from the internal Sound card output. Maybe you could confirm that.

You are correct on the waterfall frequency display. I wanted to keep it simple initially not trying to explain the frequency displayed is actually 1500 Hz offset from the waterfall frequency. I’ll take a look at a better way to do that.

Subject: [V4Protocol] 0.6.1.0 with TS-590S

Hello again Rick

I have now installed 0.6.1.0, and it works much better with the TS-590S.
VFO tracking is now OK.

But you still have an initialization issue. I see that you now force the radio to VFO-A and initialize various other parameters (BC0;NB0;NR0;FR0;FT0;RC;MD2;). That's fine, except you don't do this until V4 transmits for the very first time. Until that point, you simply request the VFO-A frequency with FA; which doesn't help if you happen to be using VFO-B. I think you should do the full radio initialization right at the start.

Two other outstanding points:
~~~~~~
1. Could you add the CAT command TX1; at the start of transmission, and RX; to terminate a transmission. This means that the radio will then switch almost immediately. Otherwise we have to use digital VOX, which introduces unnecessary delays.

2. The frequency display on the waterfall is incorrect. By putting the dial frequency in the middle of the waterfall display, you are implying that the middle of the display is the frequency you are looking at. This is not true. The middle of the waterfall is at dial+1500 Hz, and you should mark the limits as -700 and +700 (instead of 800 and 2200). Otherwise I suggest you display the VFO frequency well away from the waterfall, and clearly label it as "Dial Freq".
~~~~~~

I must say that the program is much, much improved on earlier versions I tried earlier this year, and I'm really looking forward to my first ARQ QSO. Last night I caught a few snippets on 30m, on very weak signals. Very promising.

Finn,

I defaulted the Send command to what was being used for the past few months (Ctrl + CR) ...it would have caused chaos to do otherwise. In time it could be changed but after all the guy only has to select it once, just like entering his call sign. And of course the Queue Data button always does whatever is selected.

Topic: 43 Message: 2052

I believe 0.6.0.0 still used FTP , 0.6.0.1 uses HTTP. That probably means you don't have port 8776 open for HTTP access. I want to stick with just HTTP since it is usually better with aggressive firewalls/routers that try to block a return FTP connection that is used when doing an FTP download. The fact that 0.6.0.1 is working for most people is good evidence that this is probably the best. One of the problems of course is that you need a consistent version/port/protocol of autoupdate for it work so that is why I am standardizing on HTTP and port 8776.

There will be some (due to firewall/router limitations or their inability to open up the required port/protocol) that won't be able to use Autoupdate. I can't fix that and that is why I will also post the most current version on the Yahoo FTP site. Those users will have to use uninstall and re install.

Remember auto update and keeping your version current is there to insure compatibility and to minimize support demands for back revs. Keeping your version current helps everyone.

Rick,

Icom IC-736 ("Early" Icom)
CIV Control Address Hex 40 9600Bd
USB to RS232 Converter COM4
RS232 CAT Controller powered via DTR
Separate PTT TX Line using RTS

Feedback:

Still no frequency read-back from IC-736.

Another small point, which isn't a real problem: Click on entry in Mini-Log and Transceiver goes off to frequency correctly. Re-tune radio and click on the same entry again to revert back to frequency stored there and Transceiver doesn't tune. I have to click on another Log entry and then click back to original entry to get Transciever back to that stored entry.

IP Works is a 3rd party control we are using for Internet HTTP and FTP access. It should be correctly licensed but there may be a problem which I will check into. I cannot check this on my machines since they are development machines that have the IPWorks code installed for development. There are a few such 3rd party dlls used including Microsoft's Direct X, Direct Sound and IconicZip.

Hi Rick,

I looked at the autoupdate log file and got totally confused. I have no idea what this means. What the heck is "IP*Works!" ?? I'm running 0.6.0.1.
I've included the contents of the autoupdate log file for this morning.

Tnx,
Fred, W1WYC

Rick. Yes I know. CTRL+CR was early introduced allowing for some editing before TX. But observing a lot of people on this reflector NOT moving data to outbound queue and probably not understanding why nothing went on air, I got the Idea of reverting to plain CR actually doing this move of data as the default most intuitive setting.

This way, as default, the non help readers probably increase the statistical probability of succeeding a line by line qso without reading any manual.

IF they later want the more fancy options, those options still would be there by an ACTIVE check of that hook, probably increasing a concious understanding of what will be needed by the client from that point of.

Maybe an eventual change better be done within the beta period.

Anyway Not a big deal for me.

From: G4AIU
Topic: 43 Message: 2061

Rick,

An update on my previous post:

On opening up my FT-857D computer this AM the version shown was V 0.6.0.1. I deleted this version and manually installed V 0.6.1.0 - now both the V4Chat and the TNC screens are showing V 0.6.1.0 and "Auto Update Enabled using HTTP port 8776" is displayed.

This means that both rigs - FT-847 and FT-857D are using the HTTP port 8776 with no problems and a mouse click on the Contact screen brings up the correct centre frequency.

Subject: RE: [V4Protocol] New file uploaded to V4Protocol

Rick,

Brief observations following upgrade V0.6.1.0.

My FT847 completed the Auto upgrade without any difficulty using PORT 8776. As indicated the computer-to-rig frequency changes are working without any problems. The centre RED marker on the TNC screen indicates a frequency of eg. 14073.000 when I mouse-click on the CQ contact screen. I get a reading of 14073.305 when I mouse-click on the Right hand GREEN line. When I click on the Left hand GREEN line - I get a reading of 14072.994. However, when I click again on the centre RED line I get a reading of 14072.689. These frequency changes are indicated on the rig as 14073.300 and 14072.690. I was expecting to tune to the centre line again, 14073.000 but when I mouse click on the RED line I get a reading on 14072.689. Hope all this makes sense to you!

1. My FT857D also downloaded the Auto update using PORT 8776 and the frequency of 14073.00 is displayed on the TNC screen. However, I previously downloaded V 0.6.0.1 onto the associated computer but the Header on the V4Chat and the TNC screens still reads V0.6.0.1 and not V0.6.1.0 as expected. The frequency display on the TNC screen is as follows: The RIGHT hand Green line indicates 14073.30 and the LEFT hand Green line reads 14072.70. The rig reads 14073.30 and 14072.70 respectively. When I click on

the centre RED line the frequency does not move from 14072.70 - the same frequency as the LEFT hand Green line.

Hope this helps in some way. It is now midnight and I am going to bed!!

>
~~~~~~
>1) External will use external PTT keying e.g. From a SignaLink PTT output

OK

~~~~~~
>2) Selecting another serial port will use direct PTT keying using RTS
>and/or DTR signals from that serial port.

Not on the TS-590S. On this radio the control signals are used for their
intended purpose -- flow control, not PTT control.

~~~~~~
>3) K590-Mic will key the TS-590 using the TX0 command for PTT on and RX
>for PTT off

No! You should remove that option completely. TX0 works in exactly the
same way as pressing the PTT button on the mic. That is, any noises
picked up on the mic will be transmitted. Your coughs, sneezes,
expletives and any other "noises off" will accompany your V4 signal.

~~~~~~
>4) K590-Aux will key the TS-590 using the TX1 command for PTT on and RX
>for PTT off.

That's the way to do it. With TX1, the mic input is disabled. However,
you should re-word the legend from "K590-Aux" (there isn't an "Aux" port
on the TS-590S) to "K590-Data Send".

Alternatively, you might follow fldigi's example by adding a checkbox
"CAT Command for PTT", which would remove any doubt.

~~~~~~
>
>That was done that way to allow flexibility in the selection of the
~~~~~~

>audio source. Since I don’t have a TS-590 here and didn’t see it
>in the Kenwood documentation I am not sure if the TX1 command actually
>takes the data from the Aux port or from the internal Sound card
>output. Maybe you could confirm that.

Neither.

The TX1; CAT command is completely independent of the USB audio channel.
CAT commands can be conveyed by:

1. The TS-590S UART channel on the USB port.
2. The TS-590S COM port.
3. The TS-590S ACC2 port.

As I mentioned above, the TS-590S doesn't have an "Aux" port.

~~~~~~

>
>You are correct on the waterfall frequency display. I wanted to keep
>it simple initially not trying to explain the frequency displayed is
>actually 1500 Hz offset from the waterfall frequency. I’ll take a
>look at a better way to do that.

As a quick fix, I suggest you simply move the VFO dial frequency well
away from the waterfall (so that people won't assume the displayed
frequency is the radiated frequency), and prefix the frequency with the
word "Dial:"

Then on the waterfall itself change the legend "800" to "Dial+800" and
"2200" to "Dial+2200". This way, you don't have to do any "VFO+1500Hz"
machinations.

~~~~~~

A further point. Up to now we have been speaking about forcing the VFO
to VFO-A. On reflection, I don't think it is a good idea to allow the
program to override the user's preference, possibly whipping VFO-B from
under their feet.

There must be many users who, for one reason or another, use VFO-B for
particular purposes -- for example, for convenience I use VFO-B for data
signals and VFO-A for voice signals, and my memories are set up this
way. I much prefer the fldigi approach, where they use IF; instead of
FA; This way, the program uses the VFO that is currently being displayed
-- it could be VFO-A or VFO-B. (And the frequency returned by the IF;
command is in exactly the same format as the FA; command, so little
change would be required in V4).

Thanks Fred,

I have had these license problems in the past. It is not very obvious but it is easily fixed. Basically there is something that wasn't included in the install that enables the HTTP control and I'll have to fix that. Of course that will require a new install since auto update won't run as is. Typical growing pains!

>(BC0;NB0;NR0;FR0;FT0;RC;MD2;).

I have another setting for you to initialize: PR0; This turns the
speech processor off. I discovered this afternoon that, because you
forced me to use VFO-A [grin], the speech processor was on (as it
usually is for voice). I then started transmitting V4, and only noticed
by accident that the ALC was hard at work. I shudder to think what the
on-air tones sounded like!

P.S. I had my very first ARQ QSO this afternoon, with Paul, VE9NC (thank
you Paul). It was just like AMTOR all over again, only better. I think
I'm beginning to like V4.

2072. A minor Flex problem

Yahoo group: V4Protocol
Date: 2011-09-21 20:52:42 UTC
From: kirkharding@rocketmail.com
Topic: 2072 Message: 2072

Rick,

When using V4, I utilize the DIGU function built into Flex s/w. One thing I've noticed is as soon as you place the mouse cursor in the waterfall (as an example, to adjust frequency), DIGU will immediately cause the Flex (a Flex-5000), to change to the USB function. I've confirmed this with a couple of other Flex radio users who report the same anomolly. It's not a big problem but something you should be aware of.

Kirk, K6KAR

2074. Re: [V4Protocol] V4Chat v0.6.1.0 and Icom IC-736

Yahoo group: V4Protocol
Date: 2011-09-22 02:44:21 UTC
From: Rick Muething
Topic: 2054 Message: 2074

Peter,

Well the 735 gas been reported to work with Readback on 0.6.1.0 but that is a different radio. If the frequency sets correctly you have the correct address, baud rate etc. The only thing I can do is to add additional verbose logging to capture what (if anything) the 736 sends back in response to the command for request for frequency. If you can capture that some way It would help a lot.

The set frequency only now operates on a CHANGE in the index (line) in the mini log. I can probably make it also work on just a click to the line even if no change. I'll put that on the list.

Rick KN6KB

Subject: [V4Protocol] V4Chat v0.6.1.0 and Icom IC-736

Rick,

Icom IC-736 ("Early" Icom)
CIV Control Address Hex 40 9600Bd
USB to RS232 Converter COM4
RS232 CAT Controller powered via DTR
Separate PTT TX Line using RTS

Feedback:

Still no frequency read-back from IC-736.

Another small point, which isn't a real problem: Click on entry in Mini-Log and Transceiver goes off to frequency correctly. Re-tune radio and click on the same entry again to revert back to frequency stored there and Transceiver doesn't tune. I have to click on another Log entry and then click back to original entry to get Transciever back to that stored entry.

Rick:

Perhaps having V4 interface with Commander might be an easier approach? Supporting all these different radio types is a *big* undertaking (lots of time required to fix all these issues which already have been resolved).

From: paknight1951
Topic: 2054 Message: 2077

Hi Rick,

Thanks for your quick response, as always.

As previously reported to you, the system here works fine with other s/w
such as HRD/DM/JT65 etc., so I'm certain that all is OK with the setup.
I have just copied out a section of the V4 Log where I uninstalled
0.6.0.1 and installed 0.6.1.0:

2011/09/21 12:37:30 0.6.0.1 [RadioResponse] Icom
reply:[FE,FE,F1,40,3,73,29,7,14,0,FD]
2011/09/21 12:37:31 0.6.0.1 [RadioResponse] Icom
reply:[FE,FE,40,F1,3,FD]
2011/09/21 12:37:31 0.6.0.1 [RadioResponse] Icom
reply:[FE,FE,F1,40,3,73,29,7,14,0,FD]

2011/09/21 13:07:22 {Rcv Txt Err} hM!5c! UZ=NN

I note that with 0.6.0.1 the version number is included in the log, which was helpful! But anyway, you can see the Icom replies in 6.0.1, and this seems to be replaced with Rcv Txt Err throught the whole of the 6.1.0 log. If you require the full Logs I will send them directly to you.

In terms of setting the freq via the Mini-Log, I'm just being lazy and looking for a quick way of changing Band when hunting down the (elusive) V4Chat signals! (I could quite easily press the Band Change Switch on the Radio.....). All that I have done is place the favourite V4Chat freqs at the top of the MiniLog for quick access, and it would be nice to be able to return to the original freq on any one Band after having tuned around a bit.

Thanks for all your hard work

2078. Re: [V4Protocol] Further to: V4Chat v0.6.1.0 and Icom IC-736

Yahoo group: V4Protocol
Date: 2011-09-22 12:05:07 UTC
From: Rick Muething
Topic: 2054 Message: 2078

Peter,

I think I see the problem. If you look at the Icom response from version 0.6.0.1 (the only place in the log I see a response) I see:
2011/09/21 12:37:30 0.6.0.1 [RadioResponse] Icom reply:[FE,FE,F1,40,3,73,29,7,14,0,FD]

Note this is 10 digit reply to frequency 0014072973.

That is not what the “Early Icom’s” like the 735 send...they send an 8 digit reply e.g. 14072973. If you have early Icom selected it won’t recognize a 10 digit reply. If you switch to normal Icom Amateur I suspect it will work. It is working for other Icoms using 10 digit replies (e.g. 7200)

Let me know what you find.

Ted,

Interesting. I not only see this problem on my 5000 but also on my 3000 and 1500 as well. Just assumed the problem is an anomaly between V4 and PWSDR. I also use PWSDR vs 2.2.3.

Subject: [V4Protocol] A minor Flex problem

Rick,

When using V4, I utilize the DIGU function built into Flex s/w. One thing I've noticed is as soon as you place the mouse cursor in the waterfall (as an example, to adjust frequency), DIGU will immediately cause the Flex (a Flex-5000), to change to the USB function. I've confirmed this with a couple of other Flex radio users who report the same anomolly. It's not a big problem but something you should be aware of.

Hi Rick,

Thanks for your very quick response, seeing that it must be early there!

Just to verify that the Icom IC-736 requires the Radio Settings to be:

"Icom Amateur Radios", and not:

"Icom Amateur Radios (Early)"

All now works as expected, thanks very much for the support over this.

2083. Re: [V4Protocol] A minor Flex problem

Yahoo group: V4Protocol
Date: 2011-09-22 12:44:50 UTC
From: Ted Trostle
Topic: 2072 Message: 2083

Well I am thinking there some flaky things in PWSDR. What I forgot say was that after upgrading V4 I discovered that the Frequency Memory data in my Flex 3000 was wiped out. I do not fault V4. I think I can recover from an older Flex database.

You cannot change history, but you can make history !
Education is the only legal cure for Ignorance. The Stupidity of many is
incurable.

2084. V4 Ver 0.6.1.0

Yahoo group: V4Protocol
Date: 2011-09-22 12:46:14 UTC
From: Peter
Topic: 2084 Message: 2084

Rick,

For your info:

At the moment I am using a Yaesu FT2000 with a RigExpert interface.

I had a few scrappy contacts with earlier versions of V4 Chat but the 0.6 versions are working great with some really solid qsos in the log.

Automatic update worked fine but I notice that the filter no longer works.

CAT does not work with my FT2000 or an FT1000MP MK-V.

It is now a very usable program thanks to your hard work and dedication.

73 Peter G3JFS

2085. Re: [V4Protocol] V4 Ver 0.6.1.0

From: Rick Muething
Topic: 2084 Message: 2085

Peter,
Thanks for the feedback. The filter works exactly as before it is just the waterfall is not displaying filtered data. That was necessary so you could see signals outside the filter so click-to-tune would work (its described in the help) The filter In/Out still works exactly as before and when In provides the same filtering to the decoding DSP code.

I hope to get to the Yaesu's in the next week or so.

Bernie,
There is a problem using third party “rig interfacing” programs. In ARQ mode it is ESSENTIAL you accurately control the PTT Application and release as those are critical timing parameters in an ARQ protocol. When you go through our rely on a third party program you no longer have any control over that some early tests with these kinds of programs and rig interface indicated a wide variance of timing. That might not be an issue when you are using the control to just set the frequency but when using PTT control (sent through the same serial port in some cases so it can’t be shared with other applications) variations of even 20 to 50 ms can be a serious problem. We have looked at this in the past with WINMOR and found the only reliable thing was to keep control of the serial interface.

It’s a shame some of the radio manufacturers have such sloppy control of format and documentation but that is what it is. I will get to the Yaesu’s in time trying to make sure I get the more popular models first.

Rick:

Perhaps having V4 interface with Commander might be an easier approach? Supporting all these different radio types is a *big* undertaking (lots of time required to fix all these issues which already have been resolved).

Thanks to N0LWF Lyle, problem solved. In HRD Logbook, go to Tools, Configure and then Modes and you can easily add, V4 mode.

What ADIF mode did you map V4? MFSK8 appears to be closest until we get a formal ADIF mode name assinged for V4.

2092. Operating frequencies

Yahoo group: V4Protocol
Date: 2011-09-22 18:10:19 UTC
From: John Hirth
Topic: 1731 Message: 2092

The nominal JT65 dial frequency has traditionally been 14.076, although they have been creeping down a bit lately.

There is no reason we can't operate V4Chat at 500 hz increments upward from 14.073. That would at least give us a few more "channels" to spread out to. I've already heard a few stations just above 14.073 when that frequency is busy.

Also, V4Chat has some similarities (at least in its intent) to the old Amtor ARQ and FEC. Is there any reason we couldn't TRY the "rtty segment" from 14.078-14.088 dial (about 14.080-090 rtty actual)? Yes, there is rtty there from time to time, but from what I hear in the northeast USA it's not overwhelming, and we should be able to co-exist. I've been a dedicated rtty operator in years past, and I think this might work.

With this said, there is a lot to be said for a well published frequency or two. I often leave V4Chat listening on 14.073 while I'm doing other work nearby, and jump to the rig when I hear someone call.

Just some food for thought....

Good to hear from a "dedicated rtty operator" thank you John. Unless there is a contest or a dx station about, the rtty frequencies are not too busy. We can't all snuggle up to 14.070

Subject: [V4Protocol] Operating frequencies

The nominal JT65 dial frequency has traditionally been 14.076, although they have been creeping down a bit lately.

There is no reason we can't operate V4Chat at 500 hz increments upward from 14.073. That would at least give us a few more "channels" to spread out to. I've already heard a few stations just above 14.073 when that frequency is busy.

Also, V4Chat has some similarities (at least in its intent) to the old Amtor ARQ and FEC. Is there any reason we couldn't TRY the "rtty segment" from 14.078-14.088 dial (about 14.080-090 rtty actual)? Yes, there is rtty there from time to time, but from what I hear in the northeast USA it's not overwhelming, and we should be able to co-exist. I've been a dedicated rtty operator in years past, and I think this might work.

With this said, there is a lot to be said for a well published frequency or two. I often leave V4Chat listening on 14.073 while I'm doing other work nearby, and jump to the rig when I hear someone call.

On 30m the two frequencies used for V4 are 10.131 dial and 10.136 dial.

Take a look at the 30m Band Utilization Chart for the full picture:

2099. Re: V4 Ver 0.6.1.0

Yahoo group: V4Protocol
Date: 2011-09-22 22:06:31 UTC
From: Peter
Topic: 2084 Message: 2099

Rick,

thanks for the info re the filter.

I assumed that the CAT wasn't working because the FT2000 CAT light does not came on. The click-to-tune does in fact work except that it resets the rig to SSB USB which is a slight a nuisance as I use USB PKT for all data modes. Not important as I am sure you have more pressing problems to sort out. My FT1000MP MK-V is not set up at the moment but I can do it easily if you need a report when you tackle the Yaesu CAT.

I've also have the following message in the auto update logs:

'Could not find a valid license for using IP*Works! V8 on this system. To obtain a trial license, please visit www.nsoftware.com or email support@nsoftware.com [code: G nodeid: DABVT65R]'

I looked at their website but did not find anything meaningful (to me). If this license is needed for the auto update was I just lucky that the last auto update worked?

Regards

Peter G3JFS

>
> Peter,
> Thanks for the feedback. The filter works exactly as before it is just the waterfall is not displaying filtered data. That was necessary so you could see signals outside the filter so click-to-tune would work (its described in the help) The filter In/Out still works exactly as before and when In provides the same filtering to the decoding DSP code.

As a thank you to beta testers V4Chat will auto register automatically and backup your V4 TNC ini file (which contains the registration key) in a read only backup file. Auto registration will occur after you have made a minimum number of V4 ARQ sessions. After beta testing auto registration will be removed. At this time there is no where you can “get” a registration key Registration keys are call sign specific.

From: Peter Zingsheim
Topic: 229 Message: 2102

Hello,

tnx for letting me in. Mni tnx to Rick and the folks here for all the development and the testing.

My introduction:

V4 0.6.1.0 installed, configured and working as far as I can tell.
Vintage Kenwood TS-930S (CAT enabled with Piexx cpu board, T>R modified, arq performance validated with P3). Measured T>R latency with V4 is 150ms max (most likely sound card limited).

RX ok, but no V4 sigs heard so far.
I listen erratically on 10133, 10136, 14073.
Looking fwd to 1st qso in V4 mode.

Whi I am here:
Hope for real keyboard to keyboard DX QSOs (no mailboxes, no macros), with the benefits of an affordable and narrow arq mode.

73, Peter

Hi Peter

The two frequencies on 30m where you should find V4 are 10131 (most
likely) and 10136 (less likely).

But not 10133.

For the whole picture of 30m, go to:

http://homepage.ntlworld.com/wadei/30m_band_utilization.htm

Heute nachmittag (Freitag) bin ich QRV auf 14073 oder 10131. Ich freue
mich auf unser erstes QSO!

From: Rick Muething
Topic: 2111 Message: 2111

All I am working on the last major fixes/enhancements for the next rev. I need a couple of evaluators (not many) for two important areas that I can't very well test here myself:
1) I need some that have had problems with Autoupdate. Two problems have been reported and I have made changes and added logging to fix and track these down. a) License problem with IPWorks and b) Problems believed to be related to firewall or router blocking. If you fall into one of these categories and can spare a few minutes please let me know.

2) Those with some of the more popular Yaesu models. I am still working on the Yaesu control and read back and I will probably have to make several iterations. Let me know which model(s) you have and I will get the manual (we subscribe to a download source) and try and put in the appropriate driver. If you can already set the frequency in V4 (via the mini log or waterfall click) that is a good start since half the code is there and working already.

I will send you the new evaluation code (full install) and/or post it on the Yahoo FTP. At this stage I do not want to post any untested code into the auto update server. All the changes in process are compatible with the current 0.6.1.0 rev.

73,
Rick KN6KB

Peter,

I have V4 Chat installed in both XP and Win 7. The default in both operating systems is it creates a directory called VRChat. I'm not sure how yours was installed in Program Files. I think you can copy the files in another folder without disturbing the operation of the program. In Win 7 I checked Run this program as an administrator.

Hi Rick,

I use the FT-920 and I CAN click on the waterfall and change the receiver frequency. I'm not at the rig right now
but I believe that if I click on one of the green waterfall lines it changes the receiver frequency and the frequency under
the waterfall by 200 hz. Appears to work fine. I can't change the frequency under the waterfall by tuning the receiver.
Clicking on the mini log works also and has worked since the first version of V4 I had.

Hope this helps,
Fred, W1WYC

Subject: [V4Protocol] Need evaluators for next update! (0.6.2.0)

All I am working on the last major fixes/enhancements for the next rev. I need a couple of evaluators (not many) for two important areas that I can’t very well test here myself:
1) I need some that have had problems with Autoupdate. Two problems have been reported and I have made changes and added logging to fix and track these down. a) License problem with IPWorks and b) Problems believed to be related to firewall or router blocking. If you fall into one of these categories and can spare a few minutes please let me know.

2) Those with some of the more popular Yaesu models. I am still working on the Yaesu control and read back and I will probably have to make several iterations. Let me know which model(s) you have and I will get the manual (we subscribe to a download source) and try and put in the appropriate driver. If you can already set the frequency in V4 (via the mini log or waterfall click) that is a good start since half the code is there and working already.

I will send you the new evaluation code (full install) and/or post it on the Yahoo FTP. At this stage I do not want to post any untested code into the auto update server. All the changes in process are compatible with the current 0.6.1.0 rev.

Thanks Fred,

Good that means your set function for the 920 is working and I'll put in the code for the read back (so the waterfall updates when you rotate the transceiver dial) for the 920. That code will probably work for some of the other models as well (but not all!)

Rick,

As mentioned in a recent post I have two Yaesu rigs – FT-847 and FT857D. Both rigs follow the click-to-tune frequency from the waterfall.

I would be happy to test the rig-to-computer software.

Date: 2011-09-24 08:28:30 UTC
From: oh5rm
Topic: 1996 Message: 2125

Hi Andy,
I tried similar configuration running V4 and RMSExpress in parallel and using VSPE (Virtual Serial Port Emulator) to allow CAT control from both programs. It seems to work OK but you cannot keep V4 ARQ connect open during file exchange with RMSExpress, which is a problem. Have you any solution for that?

A couple of my ARQ counter stations has done exactly as I have reverted to: Namely Hook for CR only as trigger for Outbound Queue. Other options are very good having as just that: OPTIONS. IF you REALLY need caring much about editing. That can sometimes be necessary.

Having just ENTER (CR) as the trigger, will probably diminish the occurance of stations forgetting moving their typed content into Outbound Buffer. (The non manual reader stations unless All Else Fails, hihi MANY of us all).

The operators actually Making Change from the hopefully "new defult" does that being concious about it, and they are not so prone getting in the "trap of forgetting the extra action" ctrl cr or ctrl space space.

Should not be dangerous related to backwards compatibility, since Everybody WILL get their Data into Outbound Queue this way, only a little unexpected early for someonee.

Just my 2 kroner (2/5 of a US $, hi)

EMCOMM networks using RMS Express + WINMOR in peer-to-peer mode would welcome this possibility.

In Finnish big EMCOMM excercise 2010 we had to use voice to call stations and agree on QSY to working channel for message transfer using RFSM-8000 (all stations did not have paid licence that would have allowed using FEC broadcast chat). In 2012 exercise we will use both RFSM-8000 and RMS Express + WINMOR (P2P) (different time periods). With RMS E + WINMOR we will have to resort to voice calling unless there is a simple enough way to send (at least) FEC chat.

Topic: 1996 Message: 2134

All,
While it is possible to have both V4 and WINMOR active at the same time using the same sound card this is NOT recommended. Both stations can never transmit at the same time. (While you CAN share a sound card on RECEIVE if they are using the same parameters you CANNOT on transmit.) You have to have a mechanism to OR the transmit commands (e.g. a SignaLink USB will do this since it uses VOX keying) but if you are using a serial control or CAT PTT this could be a problem (most serial ports will NOT allow two programs to access it at the same time).

2135. Feedback on Frequency read back on Yaesu Radios

Yahoo group: V4Protocol
Date: 2011-09-24 13:22:09 UTC
From: Rick Muething
Topic: 2135 Message: 2135

I have a test version that should read back the frequency on the following Yaesu radios: FT-450,FT-2000,FT-950,FT-897,FT-817,FT-847,FT-857.

But since I don’t have these radios I need someone that has one to run the new version and report their findings.

Some of the other Yaesu models MAY work selecting one of the above. The other Yaesu radios will be a while since the Yaesu CAT documentation and implementation is in a word terrible!

If you have one of these radios and wish to test the new version send an email directly to me and I will return the test version. I don’t want to post it to auto update until I have more confidence it works with the above radios.

Thanks,

Rick KN6KB

2136. Re: Marrying V4 Chat and RMS Express

Date: 2011-09-24 13:32:06 UTC
From: Ilkka
Topic: 1996 Message: 2136

Tried running both RMS E + WINMOR and V4 on my own stations.

Sharing the sound card seemed to work!

My main station sound card interface microHAM microKEYER supports two (virtual) com ports for wired PTT so the PTT was not a problem on that station.

My dummy load station is using Icom CI-V for PTT and there was a resource clash - as expected.

Any hints on virtual com port drivers that would help here?

73, Ilkka OH3NJC

Subject: [V4Protocol] Feedback on Frequency read back on Yaesu Radios

I have a test version that should read back the frequency on the following Yaesu radios:
FT-450,FT-2000,FT-950,FT-897,FT-817,FT-847,FT-857.

But since I don’t have these radios I need someone that has one to run the new version and report their findings.

Some of the other Yaesu models MAY work selecting one of the above.
The other Yaesu radios will be a while since the Yaesu CAT documentation and implementation is in a word terrible!

If you have one of these radios and wish to test the new version send an email directly to me and I will return the test version. I don’t want to post it to auto update until I have more confidence it works with the above radios.

Thanks,

Rick KN6KB

Hiya Rick,

If you want to ship the test version to me I'll see if the FT-920 is compatible with the ones you listed and get back to you.

Fred, W1WYC

Topic: 1996 Message: 2141

Ilkka. How would V4 and signalink on the rig mic and audio aux work, and another RMS E and a PTC2 OR SignaLink/WINMOR on the rear ACC radio port work?

I believe it should have reason for live, (quasi like a BPQ32 solution with WINMOR on mic, and PTC2 on rear connection).

Or maybe some solution like the coming RMS Trimode.
I don't know the mandatory HW solutions there, if used as TRI or DUAL mode).

Im thinking TWO sound cards now, but clearly see an interesting situation where several round "table" stations are QRV on V4 if noice is to heavy for Voice, and decision about when a mail is to be sendt either Pactor 1234 or Winmor P2P or even WINLINK is made known as a FEC broadcast, or a ARQ link to the recipient in particular.

2145. Test update 0.6.1.3 uploaded to Yahoo FTP

Yahoo group: V4Protocol
Date: 2011-09-24 17:46:31 UTC
From: kn6kb
Topic: 2145 Message: 2145

I have uploaded a test verstion to the FTP. This will not auto update yet. You are welcome to try it but the Yaesu radio read backs have not yet been verified and only some Yaesu models are supported. (Read the V4Chat Revision history). Please comment to me on serious omissions or problems. I would like to get this rev out and solid before adding any more "wouldn't it be nice if...." features! If you have success or failure with a Yaesu radio please post and include a referene to THIS version number and your Yaesu model. There may be some additional logging or Yaesu Radios in the main V4Chat log. The help files have been updated. If you have a question about changed operation try reading thhem first.

To install this test version you will have to uninstall and then reinstall with the new versions. When doing this DO NOT delete or modify your V4Chat.ini or your V4 TNC.ini files.

Rick KN6KB

Once we are sure this is stable I will post on auto update.

Rick KN6KB

EVERY TIME I START THE V4CHAT PROGRAM THERE IS A PAD THAT STARTS WITH
THE PROGRAM ASKING FOR A REGISTRATION NUMBER
FOR MY HAM CALL. IT GIVES A WWW.ARSFI.ORG/V4ASPX ADDRESS. WHEN YOU GO TO
THAT SITE IT ASKS FOR A DONATION TO GET THE REGISTRATION NUMBER FOR YOUR
CALL. THAT IS WHAT I DID AND IT ASKS FOR A WINLINK.ORG E MAIL ADDRESS
FOR MY HAM CALL. I DO NOT HAVE A WINLINK.ORG ADDRESS FOR MY HAM CALL SO
I ASKED TO HAVE IT SENT TO MY REGULAR E MAIL ADDRESS. THAT IS WHAT I AM
ASKING ABOUT.

From: G4AIU
Topic: 2145 Message: 2154

Rick,

My observations so far.

I have downloaded and installed V.0.6.1.3 without any problems. There is a slight change to the V4 TNC screen. A panel now says: CF:14074.5 when I click on the 14073Khz frequency in the contact screen. All my other listed frequencies show the plus 1.5Khz.

The LH Green line shows (minus) - 700Hz and the RH Green line shown (plus) +700Hz.

I KNOW HOW TO RUN THE PROGRAM WITHOUT THE REG. NUMBER. IT IS A PART OF THE V4PROGRAM THAT ASK ME TO GO TO THE SITE THAT ASK FOR A DONATION. NOW YOU TELL ME THAT IT HAS NOTHING TO DO WITH THIS PROGRAM. WHY IS IT PART OF THE PROGRAM AT ALL IF IT ISN'T PART OF THE PROGRAM? I STILL LIKE I GOT RIPPED OFF BUT THAT IS ONLY MY OPINION.

For each rig model and rig interface type there are many ways to solve the problem.

Unfortunately this is getting too complicated for the average Joe Ham EMCOMM operators.

From: Stephen West-Fisher
Topic: 43 Message: 2157

Now that all the normal life crises (two daughters in college) are under control I'm trying to work with V4 again. Previously I have been unsuccessful with ARQ contacts.

With 0.6.1.0 installed I was able to hear someone on 14.073 through all the RTTY, but since I was still reading the help I did not try to respond. Having found a quiet spot on 10m, I tried a CQ to check the T/R Latency, and I'm getting about 350ms or so. Radio is a TS-480 with that selected for radio control. K480-Aux for PTT. Sound is using the Kenwood direct cable from soundcard to TS-480. Anyone else using a TS-480 with some ideas for reducing the delay?

2158. Re: PLEASE ANSWER QUESTION

Yahoo group: V4Protocol
Date: 2011-09-24 21:03:14 UTC
From: la7um
Topic: 2146 Message: 2158

George. You are kinda right. The registration popup is relevant to what WILL be. At the ARSFI you at the time beeing can do three different actions:

1: You may pay a voluntary yearly member fee of 10$. NOT mandatory.
But I even from Norway have found it worthwile doing this.
They pay for shipments of loaner radios and other equipments for the SW developers of the WINLINK system doing all work for free!!

2: You also may pay some other voluntary support if you like and find the work of value. There are somebody finding this of value. NOT mandatory.

3: You may pay a voluntary registry for your WINLINK email SOUNDCARD PROGRAM WINMOR. NOT Mandatory.
I think it is 39$, or so. That was what I did. This is a virtual TNC, a module in the program package RMS Express handling WINMOR for email over radio.
The SW RMS Express also can handle HW Pactor tncs and Packet tncs, and connection via Telnet.

You can enable yourself with a valid WINLINK radio email account by just sending a mail to your ordinary existing email account using telnet by using free sw RMS Express. Check good info on winlink website.

I myself first enabled myself with a WINLINK radio email account.
That can be done free of charge by reading around on www.winlink.org
Check for User SW and downloads.
Download RMS Express 1.4.0.0

When opening the program just click and drag a little down the thin grey line just beneath the menu texts. This for opening a full wiew by split screen.

4: And here is where your understandable confusion is:
(I agree with you, they could have waited some weeks with that scroll page, since it is leading to no ready made end station. That's confusing)

You in the FUTURE may pay, if you like, still NOT mandatory, some registration fee to the same ARSFI for using the free chat program V4 Chat getting rid of the nagging roll down window.

Why this: It is the same SW developers making V4Chat, that makes the WINMOR and other WINLINK SW. And V4Chat already is and WILL be used by Operators of WINLINK stations in the emcomm field for some keyboard intercommunication when Voice does not make it.
It may also be used for fun only, really in the narrowband sections of the bands 200Hz BW.

Anyway, the program, as the other protocoll WINMOR will function 100% with NO reduced functionality or trial period. Just click away the nagging window.

Hope this help a little.

George,

Our records show that you registered WINMOR on 4/13 of this year and also
became a member of the Amateur Radio Safety Foundation on 9/18 of this year.
I have no record of any V4 registration - in fact, as others have stated,
the V4 registration process does not even exist. I know this as I am the one
writing the code to implement it. The V4 web page you reference states
something like: "V4 Registration is not available at this time. Check back
towards the end of the beta program."

I have not received any email message from you asking for assistance. Can
you tell me who you sent this request for help to?

2164. Re: Test update 0.6.1.3 uploaded to Yahoo FTP

Yahoo group: V4Protocol
Date: 2011-09-24 23:15:12 UTC
From: Pete Ferrand
Topic: 2145 Message: 2164

Using 0.6.1.3 this afternoon between electrical storms....

V4 CAT does not work at all with my Yaesu FT-450. I'm using Win 7 Ultimate 32 bit and digi vox on the rig. Hardware serial port card to com3.

PCC-450, the Yaesu control program, works fine.

When I try starting PCC-450 with V4 already operating, PCC-450 correctly says the com port is in use...so V4 is accessing the com port as it should. Obviously I'm not trying to operate with both together, that will never work.

Otherwise, no one is around on 10.131....I would think that being chased off 20 and 40 someone would be here :)

Stephen,

I have a 480 and the latency is under 60 ms using the SignaLink USB sound card and its Built in VOX keying. It is also about the same using CAT keying supported by the 480. You should be using a baud rate 4800 or above.

What are your radio settings? You won't be able to make a reliable ARQ connection with 350 ms latency. Something is wrong in your setup.

Now that all the normal life crises (two daughters in college) are under control I'm trying to work with V4 again. Previously I have been unsuccessful with ARQ contacts.

With 0.6.1.0 installed I was able to hear someone on 14.073 through all the RTTY, but since I was still reading the help I did not try to respond. Having found a quiet spot on 10m, I tried a CQ to check the T/R Latency, and I'm getting about 350ms or so. Radio is a TS-480 with that selected for radio control. K480-Aux for PTT. Sound is using the Kenwood direct cable from soundcard to TS-480. Anyone else using a TS-480 with some ideas for reducing the delay?

That is all correct. Please read the help file on how to interpret the waterfall screen. The value displayed is the center RF (the center of the RF spectrum) It will be 1.5 KHz above the USB Dial as described in the help.

Subject: RE: [V4Protocol] Test update 0.6.1.3 uploaded to Yahoo FTP

Rick,

My observations so far.

I have downloaded and installed V.0.6.1.3 without any problems. There is a slight change to the V4 TNC screen. A panel now says: CF:14074.5 when I click on the 14073Khz frequency in the contact screen. All my other listed frequencies show the plus 1.5Khz.

The LH Green line shows (minus) - 700Hz and the RH Green line shown (plus) +700Hz.

Topic: 2170 Message: 2170

Rick, here are some problems noted on ver 0.6.1.0
1. CAT does not work on Yaesu FT-1000MP (I know, you can only select FT-1000 and it is a different rig)
2. Autoupdate, when trying to register my V4, complained and did not complete the registration. It did however write "MISSING CALLSIGN" as registration in the V4 TNC.ini. I believe this is because my V4 TNC.ini file is from earlier versions and did not contain my callsign.

thank you for your hard work!

XP / SP 3, Flex 5000 A, PSDR 2.1.5, V4 Chat 0.6.1.0, Latency below 200

When starting the programm, the TNC Waterfall is light blue and moving.
I can see traces of activities.
After making the first ARQ-CQ Call the waterfall stays blue until the CW-ID is sent. Then the waterall changes to black and stays black during all following ARQ-CQ calls. When I restart the programm or go to setup and "upüdate" the settings (no changes), the waterfall starts again in blue and falls back to black after sending the CW-ID.
I have made contacts and exchanged messages with the "black" waterfall. Do I something wrong or is it a (cosmetic) bug?

Stephen,

I have a 480 and the latency is under 60 ms using the SignaLink USB sound card and its Built in VOX keying. It is also about the same using CAT keying supported by the 480. You should be using a baud rate 4800 or above.

What are your radio settings? You won’t be able to make a reliable ARQ connection with 350 ms latency. Something is wrong in your setup.

Yes, I got the same "MISSING CALLSIGN" update to the registration as you earlier this week. The nag has gone away but I cannot find that similar (but different) long character string as is used in RMS Express in my INI file so that I can back it up to storage somewhere. I am quite certain that I have always had my call sign and even my grid locator in the V4 Chat setup screens.

As I run a desktop and a laptop computer (less often) for digital HF, it would be nice to be able to copy that registration string to the laptop. I tried using "MISSING CALLSIGN" but it did not work on the laptop.

Rick,
When you post a question please indicate your revision. There have been several changes and pending fixes that address items. If the registration nag is gone you will ALWAYS find the registration key in the V4 TNC.ini file. There is also now software that creates an automatic backup ini file unique to a call sign when registration is successful. It is V4 TNC.ini.<call sign> and has read-only attributes which make it difficult to accidentally erase.

Also the newest test version also creates an automatic email to the V4 data base to save the registration key and call sign. You don't have to do that but it is another backup mechanism in case you don't write down the registration key (recommended) and somehow manage to erase both the V4 TNC.ini file and the V4 TNC.ini.<call sign> files.

All this explained in the updated help files with the latest test release. 0.6.1.3. I will put this on auto update as soon as I can figure out (using Yaesu's cryptic documentation) how to set frequency for at least some of the Yaesu models!

From: Rick Muething
Topic: 43 Message: 2179

Stephen,
If you are using V4 Chat and want to use radio control (Frequency and/or PTT) you must use the Radio setup menu. Read the help it explains it and there is separate page on radio setup. On that menu you select the radio, Com ports, Baud rate, other parameters. Unless you have those set up correctly and they match the radio (baud rate etc) it won't work. The help discusses the four ways of keying and you must use one of the four (they all will work but some may be more convenient) If you have a question that the help doesn't answer then post it to the forum and describe the setup you have and what your radio control settings are. Be sure to include your radio model and the software revision of V4 Chat you are running.

Vista has nothing to do with it (but I recommend Win 7 for fewer headaches!). You can use the internal sound card but it is not recommended. You will still need an isolated (optical or transformer) audio interface to the radio and if any program (Windows or any other program) attempts to "grab" the sound card you will be out of luck and the program will fail. The sound card cannot normally be shared across active applications. I would recommend something like the SignaLink USB if you don't already have a good sound card interface although others will also work fine.

Rick, after checking the failed registration, here is my findings (ver 0610):

1. I have no hex-string in my V4 TNC.ini, only Registration=MISSING CALLSIGN and I my callsign is not in the V4 TNC.ini (and no nag screen)

2. I cannot find any file named V4 TNC.ini.[call] on my entire hd (I checked)

3. If I go into Sound Card TNC Basic Setup it tells me my callsign and registration=MISSING CALLSIGN but but when I try to update, it complains that the call and registration does not match. It will however write a new V4 TNC.ini with my call and Registration=MISSING CALLSIGN and the nag screen is back. If I then edit out my call from the V4 TNC.ini the nag screen is gone.

So I guess my registration has failed after all....

If the registration nag is gone you will ALWAYS find the registration key in the V4 TNC.ini file. There is also now software that creates an automatic backup ini file unique to a call sign when registration is successful. It is V4 TNC.ini.<call sign> and has read-only attributes which make it difficult to accidentally erase.
> >
> > Also the newest test version also creates an automatic email to the V4 data base to save the registration key and call sign. You donâ□□t have to do that but it is another backup mechanism in case you donâ□□t write down the registration key (recommended) and somehow manage to erase both the V4 TNC.ini file and the V4 TNC.ini.<call sign> files.

2187. V4Chat 0.6.1.3 Test.zip

Yahoo group: V4Protocol
Date: 2011-09-25 17:53:39 UTC
From: k1dow_4
Topic: 2187 Message: 2187

I just downloaded and manually installed V4Chat 0.6.1.3 on my Win XP home edition system.

When it booted up here is what I got:

*** Startup of V4Chat Ver 0.6.1.3 ; Auto Update Enabled using HTTP port 8776
*** Failure to open Command Port 8510 to V4 TNC.
Check and make sure port is unused.
*** Failure to open Open V4 TNC.

This was a first for me. I rebooted the OS just to be certain nothing else has somehow grabbed the port, but got this same error message.

I then manually re-installed V4Chat Ver 0.6.1.0 and all is well again.

If this comes up again ....

At the XP command prompt, type
netstat -ano

You'll get a list of active localhost (and other) IP addresses and their states. If the subject port is taken, the application or entity that has it should be listed, and you can resolve the conflict.

Rick,

Regarding the "Are you sure you want to do this?" popup that comes up when you select "Clear All" - I think just simply selecting "Clear All" and having it clear the selected screen should suffice as I think it's pretty clear what going to happen when you select this option.

I hope I'm not alone on this last suggestion, but (speaking for myself)I would find it a whole lot easier on my eyes if I had the choice of a somewhat larger font to use in my typing box. Even a bit larger fixed font would be great if offering a variable sized font would be more than you want to get into graphic wise at this time.

2190. RE: [V4Protocol] TS-480 Problem

Yahoo group: V4Protocol
Date: 2011-09-25 20:09:14 UTC
From: Stephen West-Fisher
Topic: 43 Message: 2190

As I said, the program is setup for Kenwood CAT on com1 at 9600 baud. PTT is set for K480-Aux. This should have the quickest T/R switching correct?

I am using the internal sound card since that works well for other modes, but it could be the problem – that is what I am trying to find out.

As it happens, W7 is happening tomorrow.

To: V4Protocol@yahoogroups.com
Subject: Re: [V4Protocol] TS-480 Problem

Stephen,

If you are using V4 Chat and want to use radio control (Frequency and/or PTT) you must use the Radio setup menu. Read the help it explains it and there is separate page on radio setup. On that menu you select the radio, Com ports, Baud rate, other parameters. Unless you have those set up correctly and they match the radio (baud rate etc) it won't work. The help discusses the four ways of keying and you must use one of the four (they all will work but some may be more convenient) If you have a question that the help doesn't answer then post it to the forum and describe the setup you have and what your radio control settings are. Be sure to include your radio model and the software revision of V4 Chat you are running.

Vista has nothing to do with it (but I recommend Win 7 for fewer headaches!). You can use the internal sound card but it is not recommended. You will still need an isolated (optical or transformer) audio interface to the radio and if any program (Windows or any other program) attempts to "grab" the sound card you will be out of luck and the program will fail. The sound card cannot normally be shared across active applications. I would recommend something like the SignaLink USB if you don't already have a good sound card interface although others will also work fine.

Subject: RE: [V4Protocol] TS-480 Problem

I’m using 9600 baud on the serial line. When you say radio settings so you mean the transceiver or the V4?

I’m also using a laptop running Vista, could the problem be related to the internal sound card?

Subject: Re: [V4Protocol] New file uploaded to V4Protocol

Stephen,

I have a 480 and the latency is under 60 ms using the SignaLink USB sound card and its Built in VOX keying. It is also about the same using CAT keying supported by the 480. You should be using a baud rate 4800 or above.

What are your radio settings? You won’t be able to make a reliable ARQ connection with 350 ms latency. Something is wrong in your setup.

You may also want to use "netstat -anob". The "b" will provide you with the actual program name associated with the port numbers. If you are using Vista and I assume Win 7, you will need to RIGHT click on the CMD icon and select "Run as Administrator". The "b" option requires you to have administrator privileges. The "b" option also causes netstat to run slower. It looks like the program has stalled, but it hasn't.

From: turi8712
Topic: 2171 Message: 2198

Hi Rick

thank you for your answer. I tried it with the Dummy load = no change, after the first CW-ID waterfall becomes black. I reduced also the power to 2 watts = no change.

Went to "seup" and unchecked "Idfentify with Morse Code" (switched off the CW ID). Without the CW ID the waterfall stays blue.
So it seems there is some bug in connection with the CW-ID.

Arthur HB9LAM

BTW: in RMS Express I do not have this problem with the CW-ID

Russ,
That can happen if one of two things occurs:
1) Another program is running and using the requested port. (if so you can re assign the port used by V4 in the setup)
2) There is still a stub of the V4 TNC running. Task manager will show it in the processes and can kill it. Rebooting will also kill any left stubs. Normally this is only due to a program failure that failed to properly shut down the V4 TNC.

Stephen,

The internal sound card will work but if you are serious and want to get past the experimentation phase you will get a dedicated soundcard and interface for sound card modes. Believe me I have heard too many “Windows sounds” on the airwaves from users that felt sure they could use the built in sound card.

I have a TS 480 and on my rig using serial control on 9600 baud and K480-Aux keying I get about 60 ms latency. The sound card should not be a factor since it should be running during transmission. You must have some background noise and the receive drive level correctly set to make a valid latency measurement....It is the recovery time to and recognition of that background noise that is measured.

2204. Yaesu FT2000

Yahoo group: V4Protocol
Date: 2011-09-26 19:10:47 UTC
From: Peter
Topic: 2204 Message: 2204

Rick,

Had two good qsos with 0.6.1.3 today despite some disruption by very unstable propagation.

The CAT on my FT2000 started to work again today - it had worked briefly when I first installed the 0.6 version but has not worked since. I happened to click on a call in the log pane and saw:

***Freq Changed:14073KHz Dial appear in the Transmit window.

I clicked several more times in the waterfall and the changes were registered in the box beneath the waterfall and on the transceiver dial. The rig CAT light also blinked on each click.

On closing and restarting V4 the CAT did not work until I clicked again on a log book entry. I have repeated this process several times and so far it has worked each time.

I know nothing about programming but could the serial data settings affect the cat operation? The operators handbook for the FT1000MP MK-V is most specific. It states:

4800bits/sec, 1 start bit, 8 data bits, no parity and 2 stop bits.

For the FT2000 it is anyone's guess as CAT control is not mentioned in the operators handbook although there is a menu option to set the Baud rate. I use the Mark-V data settings with my FT2000 and these work OK with a RigExpert Standard or a home-made interface using COM1 on a Windows XP machine.

The CAT control for other programs that I use like MixW and DxLab require you to enter all of the serial data when setting up. Maybe this is taken care of in your software. As I said I know nothing about programming but thought I would mention it.

V4 continues to head in the right direction so keep up the good work Rick.

Rick,

I forgot to mention that altering the tuning on the FT2000 has no effect on the V4 display.

From: Rick Muething
Topic: 2196 Message: 2207

Rick,
In an ARQ system you can’t have two stations being the Sending station (ISS) it just doesn’t work. When someone is calling CQ they are making a call to a fictitious station “CQ” and that is shown to others so they know they who is calling and that they will accept calls from anyone. ..If you tried to call to them during their call you would have two ISS stations on the same frequency at the same time and it just won’t work. Its EXACTLY like when some calls CQ via SSB or non break in CW. You can’t call them while they are transmitting....since they aren’t listening! If however you KNOW the station is on frequency and listening you can always call them directly (no CQ needed) .... The CQ in V4 means just what it means in any other mode. “I am willing to talk to anyone that replies”. The same restrictions applies to Pactor or other ARQ modes

Subject: [V4Protocol] Re: Question

Rick,

Yes, indeed, that's the way I have been doing it, but thought it would be neat to be able to connect while the other station was calling CQ. But....that might bring up some cans of worms. (plural)
Just thought I remembered seeing that.
Thanks for the info....
Neat program and I'm having lotsa fun with it.

Arthur. I answered some arq calls from you earlier today. It seems that you dont get my bursts due to some latency or vox delay, OR some RFI. But ur signals sounded very nice!!!, so I don't belive in RFI.

I belive more in switch over trouble not getting the leader of my resondings.

Good Yussi. Then we have somewhere to try. LA5VNA and I did some very nice agreed 60m links some days ago, but none of us knew where to go elsewere. Since you are doing LA3F-5 pretty good, I would assume that there might be some 80 or 40m possibilties....Exept that MY private qth has way much more noisy RX than LA3F-5.

2211. V4Chat 0.6.2.0 Uploaded to Auto update and Yahoo FTP

Yahoo group: V4Protocol
Date: 2011-09-27 01:36:41 UTC
From: kn6kb
Topic: 2211 Message: 2211

All,

I have made some changes to the Radio Readback in an attempt to fix the Yaesu read back or at least get some more info on it. The Yaesu radios are not responding as expected and described in the (minimal) Yaesu documentation. Frequency setting should be OK.

This has also been posted to auto update but if you have had a license problem with the IPWorks controls you will have to first download the file licenses.licx also posted on the Yahoo site. This files goes into the execution directory. You can also of course download the full install of 0.6.2.0 and do the normal uninstall/reinstall.

Please do not erase or delete your V4Chat.ini file. This has important information regarding registration. If you have made sufficient V4 ARQ QSOs to get your beta version registered be sure to write down the Registration key in a safe place. It is a hassle retrieving keys if they are lost. The key can always be read by viewing the Registration menu on the V4 TNC program.

If you have a Yaesu radio and have either success or failure with frequency read back on THIS revision please post a message indicating your results and your Yaesu Radio model. If you have a readback failure with one of the currently supported Yaesu models (see the revision history for those models) PLEASE send me the main V4Chat log (not the debug log). It contains some important info captured from the Yaesu Radios.

Remember when all else fails try reading the help...all updated.

Good luck,

Rick KN6KB

Rick -

Auto update worked on the second try. The first time the program up in version 0.6.1.3 after the restart. However on the second try after the program reported the undate was finished and that I needed to restart. I did restart and it came up 0.6.2.0. Success!

Rick,

The new version auto updated as expected on both my Yaesu FT-847 and FT-857D without and problems.

On first start-up the FT-847 waterfall CF frequency now reads 1500Hz - vice 1523Hz on previous versions. All other frequencies in the mini log now read (plus) +1500Hz.

The rig-to-software facility does not work on either of my Yaesu rigs.

Rick,

Auto update of 0.6.2.0 worked fine on first switch on today.

FT2000 CAT is still working as reported in my previous posts:

1. I have to click on a log entry to start the CAT working.
2. On clicking in the waterfall frequency changes are registered on the waterfall display and the transceiver. The CAT light blinks(as it should).
3. FT2000 vfo tuning control changes are not registered on the display.
4. FT2000 operating mode is changed from PKT to SSB.

Rick,

Thanks for your explanation. I'm quite certain it was case #2 as I had been experimenting with V4 and had restarted it several times. A clean reboot of the computer solved the problem.

Ron,

You cannot do an auto update manually ...the files are password protected by design.
I posted the solution to this several times:
1) If you are using 0.6.1.0 and it doesn't auto update download the license.licx file on the FTP and replace the one in your Execution directory. Autoupdate will then work IF You have the required port open.
OR
Forget 1) above and simply download the new install. and Uninistall/reinstall as in the past. Auto update will then work in the future IF you have the required port open.

I can't make it any clearer than that.

2222. V4 Registration -- Callsign: Key: MISSING CALLSIGN

Yahoo group: V4Protocol
Date: 2011-09-27 14:22:21 UTC
From: Peter Zingsheim
Topic: 2222 Message: 2222

Hi,
pse enlighten me:

On restarting V4Chat I got a pop-up window with the following info, among others:

V4 Registration -- Callsign: Key: MISSING CALLSIGN

This tried to send an e-mail, assuming Outlook Express being my default mailer (which is not, for good reasons),
to some mail address (not sure if it is to be disclosed here),
with a subject line reading: "Auto Beta V4 Registration for:"
and in the message body: V4 Registration -- Callsign: Key: MISSING CALLSIGN

Ok, so I copied all the above into the appropriate places and sent it away from my mail client. It did not bounce.

No idea what I should have done. Nor what I should expect, now.

All very cryptic. I may have overlooked, where the process is described. If so, sorry.

Tnx fr your patience,

Peter

Autoupdate worked great here to 0.6.2.0....Win7 32 bit Ultimate. Cool to see the in-progress messages a few minutes after starting the program this morning.

Rig control still not working with my Yaesu FT-450 at 19200, tried with and without the rts/dtr.

Thanks.

Stephen,

The internal sound card will work but if you are serious and want to get past the experimentation phase you will get a dedicated soundcard and interface for sound card modes. Believe me I have heard too many "Windows sounds" on the airwaves from users that felt sure they could use the built in sound card.

I have a TS 480 and on my rig using serial control on 9600 baud and K480-Aux keying I get about 60 ms latency. The sound card should not be a factor since it should be running during transmission. You must have some background noise and the receive drive level correctly set to make a valid latency measurement....It is the recovery time to and recognition of that background noise that is measured.

Rick

On September 23 you sent version 0.6.2.0 to Ron (NY3J) and me for evaluation, and the next day I replied to you with details of a number of bugs.

Question: Is the 0.6.2.0 that you have now announced in this thread for general consumption exactly the same as the 0.6.2.0 that you sent to Ron and me on the 23rd?

If not, should I uninstall my 0.6.2.0 and download your publicly announced 0.6.2.0?

Or should I let my 0.6.2.0 (try to) auto-update anyway?

What was sent to you on Sept 23 was Version 0.6.1.1 I always publish new updates on auto update with a 0 in the last digit. All new updates are always higher than any previous version. Many users are sloppy when it comes to saying what their version is. 0.6.1.1 is completely different than 0.6.2.0 . There is no version 6 etc. For auto update to work it REQUIRES careful control of revision numbers. The latest version is 0.6.2.0 and that is on the web site and posted on auto update.

2238. 0.6.2.0 with TS-590S

Yahoo group: V4Protocol
Date: 2011-09-27 18:36:45 UTC
From: Ian Wade G3NRW
Topic: 2238 Message: 2238

Rick

I have just tried 0.6.2.0 with the TS-590S, and it's looking good! No problems with tuning, either from the VFO knob or from the waterfall. The waterfall center frequency is now displayed correctly.

However, there are just a few minor issues remaining:
~~~~~~
1. With 0.6.1.1 already installed, I started the program, and expected an auto-download of 0.6.2.0 ("Enable Auto Updates" is checked). Nothing happened. I then clicked on "Update", and auto-update apparently worked ("Restart V4 Chat to run new version"), but the title bars remained at 0.6.1.1. I then shut down and restarted, whereupon the title bars showed 0.6.2.0 correctly.

~~~~~~
2. During the update, no Registration message was produced, and no error messages appeared. Does that mean I am registered? It would be helpful to include a "Registered to <callsign>" message in the "About V4 Chat" window, then we know where we stand.

~~~~~~
3. Radio Initialization: I see that you force the user to VFO-A. Why not allow the user to choose which VFO to use, by selecting VFO-A or VFO-B on the radio before starting the program? You can then read the selected VFO with the "IF;" command (instead of "FA;"). This will help users who use the radio's VFO-B memories for digital frequencies. (This is how fldigi does it).

~~~~~~
4. Radio Initialization #2: You set VFO-A to simplex (with "FR0;"). That's fine, but you then set VFO-A to split (with "FT0;"). I don't understand the purpose of this.

~~~~~~
5. In the Radio Settings form for the TS-590S PTT Port, you offer the "K590-Mic" and "K590-Aux" options.

You should remove the "K590-Mic" option completely. This option sends "TX0;" to the radio, which has exactly the same effect as pressing the mic's PTT button -- the V4 signal will be accompanied by any coughs, sneezes, expletives and other noises picked up by the mic!

The only option you should offer K590 users here is marked "K590-Aux", which sends "TX1;" to the radio, and inhibits the mic. However, you should rename the option to include Kenwood's official designation, and call it: "K590-Data Send". The TS-590S does not have an Aux port.
~~~~~~

~~~~~~

Despite these minor points, the whole package is looking really good
now. Many thanks for all the effort you have put into it.

From: Stephen West-Fisher
Topic: 43 Message: 2239

I understand that it works, just not in this case. Not much can be wrong with a shielded serial cable connected to the radio with parameters matching between computer and radio.

However, I am wondering if there is a problem with the serial port on the docking station, or some interference between the serial port and the sound card with this laptop.

Anyway, I have a configuration that should work now. I just wanted my resolution on the list in case someone else runs into the same problem.

Ian,
There is a problem on the auto registration if you never saved your call sign to the V4TNC.ini file. I'll fix this with the next release which I am testing. It should correct any problems with blank call signs and reissue registration keys.

Re: "I then clicked on "Update" Where did you "click on update?" There is a check box in the V4 Setup that says Enable auto update. If that is NOT checked and SAVED to the ini file (update) it will never auto update. There are some out there that asked for that enable feature (I'm not sure why...it makes more work for everyone). It defaults to enabled so if it wasn't you must have selected to disable it.

When auto update occurs it says it was successful and then says "Restart to run the new version". The files have been updated but you are STILL RUNNING the version you started with. I have purposely not enabled auto restart (not too convenient if you're in the middle of a QSO!) so that requires you to shut down and then restart to execute the new version. The title bars read the old version because simply it IS still running the old version until it is restarted. All that is working normally as designed.

~~~~~~
1. With 0.6.1.1 already installed, I started the program, and expected an auto-download of 0.6.2.0 ("Enable Auto Updates" is checked). Nothing happened. I then clicked on "Update", and auto-update apparently worked ("Restart V4 Chat to run new version"), but the title bars remained at 0.6.1.1. I then shut down and restarted, whereupon the title bars showed 0.6.2.0 correctly.

~~~~~~
2. During the update, no Registration message was produced, and no error messages appeared. Does that mean I am registered? It would be helpful to include a "Registered to <callsign>" message in the "About V4 Chat" window, then we know where we stand.

~~~~~~

3. Radio Initialization: I see that you force the user to VFO-A. Why not allow the user to choose which VFO to use, by selecting VFO-A or VFO-B on the radio before starting the program? You can then read the selected VFO with the "IF;" command (instead of "FA;"). This will help users who use the radio's VFO-B memories for digital frequencies. (This is how fldigi does it).

~~~~~~

4. Radio Initialization #2: You set VFO-A to simplex (with "FR0;"). That's fine, but you then set VFO-A to split (with "FT0;"). I don't understand the purpose of this.

~~~~~~

5. In the Radio Settings form for the TS-590S PTT Port, you offer the "K590-Mic" and "K590-Aux" options.

You should remove the "K590-Mic" option completely. This option sends "TX0;" to the radio, which has exactly the same effect as pressing the mic's PTT button -- the V4 signal will be accompanied by any coughs, sneezes, expletives and other noises picked up by the mic!

The only option you should offer K590 users here is marked "K590-Aux", which sends "TX1;" to the radio, and inhibits the mic. However, you should rename the option to include Kenwood's official designation, and call it: "K590-Data Send". The TS-590S does not have an Aux port.

~~~~~~

Despite these minor points, the whole package is looking really good now. Many thanks for all the effort you have put into it.

>Ian,
>There is a problem on the auto registration if you never saved your
>call sign to the V4TNC.ini file.

I had entered my callsign into the V4 Chat setup box the first time I used the program, several versions ago, and it is used correctly when carrying out QSOs.

However, V4TNC.ini contains:
~~~~~~
Registration Email Sent=True
Registration=MISSING CALLSIGN
~~~~~~

But the registration email was *not* sent, because at the time there was no email client set up on the machine.

(I subsequently set up an email client, ready for V4 to send a registration message, but message came there none).

That is why I suggested that V4Chat contains a positive "registration successful" message.

>
>Re: “I then clicked on "Update" Where did you “click on update?”

I clicked the "Update " button on the V4Chat Setup window.

>There is a check box in the V4 Setup that says Enable auto update.

I checked this box several versions ago.

QUESTION: It seems that V4TNC.ini has got out of step somehow. Should I remove it and let V4 build a new one?

>
>When auto update occurs it says it was successful and then says
>“Restart to run the new version”.

That is exactly what happened, but only after I clicked the "Update" button. The program did not auto-update by itself (or maybe I didn't wait long enough?)

Ian,

I cannot tell within the program whether you actually send the pre pared Email message. That is separate program like Outlook or whatever your default email handler is. The purpose of the email is simply a backup to the backup saved in the backup ini file to the backup piece of paper you are supposed to write down the registration key. I think that is enough.

The problem was with the call sign saved in the V4 TNC.ini file (or more correctly not saved). Remember these are separate programs each with their own ini file (because other developers use the V4 TNC.exe). This will all be corrected on the next release.

2244. New Version 0.6.3.0 uploaded to Yahoo FTP and auto update server

Yahoo group: V4Protocol
Date: 2011-09-27 21:03:40 UTC
From: kn6kb
Topic: 2244 Message: 2244

This version should fix problems with the auto registration mechanism. For it to work you must not delete or manually edit your V4TNC.ini file. When auto registration works remember to write down the key somewhere as a backup to the other backup mechanism employed. Tracking down your registration key is a time consuming process.

There is still a problems with receiver frequency read back on Yaesu. That will take a while to fix but all other aspects of radio control should work OK.

Remember for auto update to work you must:
1) Have auto update enabled in your V4 Chat setup.
2) Have internet access and have http port 8776 open in your router or firewall.
3) Be running version 0.6.0.0 or later.

From: Juhani
Topic: 2247 Message: 2247

Auto update works now fine. One question: I use two computers; one is this ACER desktop in home and 2nd W7 starter "HP mini 100e" (BTW: HP is vy ok by V4 etc digital programms!) because I need laptop in my holiday cottage in Lapland and no 230 VAC there, I have only solar cells.
So, I copied my registration key to laptop. I hope all is ok and also laptop will do update without any problems and 2nd registration key??
73 "Yussi" OH7TE

post scriptum: /IF/ I will use call OH7TE/P call there I need 2nd key anyway?

Topic: 2247 Message: 2248

Yussi, All
The registration key and mechanism are keyed to a call sign. You can copy over the ini file or otherwise use the Registration form to register another instance or computer as long as it is the same call sign (or any –ssid of the same call sign). The auto registration will only work for one call sign.
Autoupdate has nothing to do with registration...it is just the mechanism used to update the program.

Rick,

I have successfully auto updated from 0.6.2.0 to 0.6.3.0. I don't get prompted for registration but when I look at the V4TNC.INI file it says Registration=MISSING CALLSIGN. I am using Windows 7. I'll send you the file.

Rick -

I thought the auto update to 0.6.3.0 went OK because it launched OK right after the update. However, an hour later when I launched it (after running FLDIGI), V4CHAT failed to open the TNC part of the application. I restarted the computer and tried again with the same results. I reinstalled the last version I had downloaded 0.6.1.3 and am running that fine now.

When I attempted to launch 0.6.3.0 I was presented a registration code screen - I clicked OK on this before I noticed the problem with now TNC application launch.

I'm running Windows 7 Home Premium 32-bit for my O/S environment. My log snippet is below starting with where I tried to start 0.6.3.0 and then the successful launch of 0.6.1.3.

Subject: Re: [V4Protocol] Auto update and key code for two PC's

Rick -

I thought the auto update to 0.6.3.0 went OK because it launched OK right after the update. However, an hour later when I launched it (after running FLDIGI), V4CHAT failed to open the TNC part of the application. I restarted the computer and tried again with the same results. I reinstalled the last version I had downloaded 0.6.1.3 and am running that fine now.

When I attempted to launch 0.6.3.0 I was presented a registration code screen - I clicked OK on this before I noticed the problem with now TNC application launch.

I'm running Windows 7 Home Premium 32-bit for my O/S environment. My log snippet is below starting with where I tried to start 0.6.3.0 and then the successful launch of 0.6.1.3.

73, Bill K1CT

2254. Re: [V4Protocol] Auto update and key code for two PC's

Yahoo group: V4Protocol
Date: 2011-09-28 08:24:15 UTC
From: Rick Muething
Topic: 2247 Message: 2254

Bill,
There is no problem with 0.6.3.0. The only problem your log showed is when the port was in use. It is working for most people and the software is the same. If the TNC failed to start it is because:
1) The Port being used by the TNC is in use. The default port is 8510 (and 8511) but any unused port will work. It can be setup in V4Chat.

2) Most likely. You have a stub running of the V4 TNC. Use the task manager to kill it or reboot the machine.

3) Generally do no go back and reinstall a back version. If you need a full install go to the Yahoo FTP site and download and install the latest version there. I usually always post a new full install with each auto update.

Subject: Re: [V4Protocol] Auto update and key code for two PC's

Rick -

Update to below. After I reinstalled 0.6.1.3, auto update proceeded and when I restarted to 0.6.3.0 it broke again. Log snippet pasted below.

Rick,

thanks,

1) autoupdate from 0.6.2.0 to 0.6.3.0 worked on WinXP pro SP3 within 5 min after starting V4Cat (Firewall disabled temporarily).
2) V4 TNC.ini shows callsign correctly
3) V4 TNC attempts to send an e-mail, mail body contains reg. code
4) e-mail attempt manually aborted because invalid mail client (MS) assumed per default by TNC (this is a rough spot, not everyone uses MS clients)
5) info from 4) copied into standard mail client and sent
6) e-mail did not bounce
7) V4 TNC.ini.OE6ZH exists and manually invoked registration pop-up displays reg. code
8) hitting "Register" (not greyed) button loops back to 3) above effectively starting round 2
9) mail attempt aborted, because mail sent in step 5) of round 1
10) All working

Rick,

V4 updated to 0.6.3.0 on switching on this morning. Working OK but no auto registration as mentioned below.

FT2000 CAT is unchanged from my previous postings. Do you have the Yaesu 'FT-2000 Series CAT Operation Reference Book' that is supplied with the rig? With 17 pages of data it seems comprehensive enough. If you need it it may be download from the Yaesu website.

Ian. I also got that Outlook setup. I just cut and pasted the adress, the subject and the text in three steps into my Web Gmail account and sent from there. I assumed it was for an extra backup at the ARSFI.

This way I as a bonus have a backup within my gmail account as well.

I have sent similarly to myself also the WINMOR registration code, just for extra backup.

Hi Rick,

Thought I'd let you know that autoupdate worked fine. I was running 0.6.2.0 and after a few minutes
of turning on the pc and invoking V4 it came up with the message that it had updated to 0.6.3.0.

Thanks & 73,
Fred, W1WYC

This version should fix problems with the auto registration mechanism. For it to work you must not delete or manually edit your V4TNC.ini file. When auto registration works remember to write down the key somewhere as a backup to the other backup mechanism employed. Tracking down your registration key is a time consuming process.

There is still a problems with receiver frequency read back on Yaesu. That will take a while to fix but all other aspects of radio control should work OK.

Remember for auto update to work you must:
1) Have auto update enabled in your V4 Chat setup.
2) Have internet access and have http port 8776 open in your router or firewall.
3) Be running version 0.6.0.0 or later.

Rick,

ver. 0.6.3.0 autoupdated just fine here and is working like a champ.

Thanks for your work.

A tiny request if you happen to be passing by the correct part of the code....the ability to move the right side of the mini log further to the right. I have a 24" monitor and would like to see the whole entry line. I have it moved as far as it will go and can only see Grid Square/QT ...

And thanks for straightening me out on the "connect while rx a CQ" confusion I had. Head up and locked here. I know very well about ISS and IRS....just forgot. At 74 things don't present themselves from recall very well.

Rick, I'm getting warmer. I just let the auto update to 0.6.3.0 go
ahead. No hitches or glitches.

(The reason the previous auto update didn't work at first was that I
didn't wait long enough).

However, I still don't know if I am registered. Here is my V4 TNC.ini
file in its entirety:
~~~~~~
[V4 TNC Form]
Top=462
Left=105
SC Cal offset=544932
Squelch=4
Filter=False
Registration Email Sent=True
Registration=MISSING CALLSIGN
MyCall=G3NRW
~~~~~~

"MyCall" has appeared in the file tonight for the very first time.
However, because a previous registration attempt was unsuccessful (there
was no mailer on the machine at the time), it seems that I still haven't
registered. How do I recover? Should I change "Registration Email Sent"
to False?

Please EVERYONE...DO NOT TRY AND MODIFY AN INI FILE . If you make a syntax error your program may not work and I don't have the time to correct all this. The program will autoupdate if you follow the instructions in the help. It will auto register if you make the required contacts and keep your version current. This has been verified.
It is not REQUIRED that you send the registration email...it is only to make it easier for me and Lee (who handles the registration mechansim) to look up YOUR registration key if you loose it. If you really want to help don't loose the registration key or learn to live with the nag if you do.
If you can't figure out how to get auto update to work AFTER reading the help then just use the full install mechanism.

Ian,

I will look at your other suggestions. Re allowing the user to select A or B was considered but it REQUIRES you have read back or forces more radio specific complexity in the Radio setup page. Readback is not required now and is not implemented by some simple interfaces. Since I am using the same driver as other programs I would prefer not to have to change all them or create a completely new driver class. Plus getting into the details of which VFO/Memory to use, what filter to put in, preamp etc dramatically increases the radio specific complexity with minimal benefit to the average user. Especially Yaesu's that seem to have a different code and format for almost every model.

Thanks for your feedback. I've put some of the items on the list but I NEED to block out some time for other projects I need to finish and support.

I have restarted the program several times today but it did not happen for me.

I have not changed the .ini files in any way but I did enter some contacts directly into the log at the left hand side of the main window before I found the Add/Edit contact box a couple of days ago. Could this be the problem?

All understood Rick. I realize some of the issues I mentioned are
"nice-to-haves", but none of them are show stoppers for the TS-590S.
Everything is working very well now.

(P.S. Whom do I send the bill to for relay replacements? It's almost as
bad as AMTOR used to be).

Hi Yussi

Yes, it was a FB QSO. You could have reduced your power to 5 watts also,
and I am sure I would still have copied you without difficulty. That
part of the band was very quiet at the time.

Later I did hear OH7JTT's CW ID, but I couldn't connect.

I will be on 3590 again tonight (Thursday), from about 1900 UTC.

All understood Rick. I realize some of the issues I mentioned are
"nice-to-haves", but none of them are show stoppers for the TS-590S.
Everything is working very well now.

(P.S. Whom do I send the bill to for relay replacements? It's almost as
bad as AMTOR used to be).

2282. Version 0.6.3.0 Filter

Yahoo group: V4Protocol
Date: 2011-09-29 19:58:50 UTC
From: Harry
Topic: 2282 Message: 2282

Rick

Everything works very well except for the Filter. When clicking on the filter the waterfall does not shrink to 200 Hz. I recall it working several versions ago. That feature is very helpful.

A contact today with NY3J confirmed that the Filter does not work at is location.

Thanks for the great work on V4

2285. Re: [V4Protocol] Re: Version 0.6.3.0 Filter

Yahoo group: V4Protocol
Date: 2011-09-29 21:07:06 UTC
From: Rick Muething
Topic: 2282 Message: 2285

Guys....PLEASE may I suggest we take just 30 seconds to LOOK into the help before:
a) Asking a question
b) Answering a question your not sure of

E.g. On V4Chat With three clicks: Files, Help Contents, V4 Virtual TNC I get a page that describes virtually EVERYTHING displayed on the V4 TNC form.
Scrolling down to the Filter IN/Out description I see:
The Filter In/Out menu item will enable/disable the internal 400 Hz BW filter (centered on 1500 Hz). When IN this filter may improved decoding in high noise or QRM conditions. When IN the V4 signal should be within +/-100 Hz of the nominal tuning. The Filter does NOT affect the waterfall display allowing you to see adjacent V4 activity and allows the "click-to-tune" capability of the waterfall.

This is a lot faster (and usually more accurate) than posting a question, waiting for replies, (which may or may not be accurate!). If it isn't covered in the help and it is a legitimate question then ask and suggest I add a help topic or explanation. Or suggest an improved method of navigating to the topic. Remember with virtually EVERY update of the code the Help is updated to reflect any changes. The filter operation is an example of that because it was changed to allow "click to tune" ("click to tune" wouldn't work well if the filter cut off all the signals in the receiver pass band).

In addition to the Help Topics there is a Help index of key words in both the V4TNC and V4Chat help files. Those key words will get you to the help page with the description of the key word.

2290. 20 mtr Dead as Dodo in VK

Yahoo group: V4Protocol
Date: 2011-09-30 13:18:40 UTC
From: dromana@drivein.net.au
Topic: 2274 Message: 2290

Hi all,
0.6.3.0 installed manually fine, but 14073 - 20 mtr in general has been dead in VK for over a week now.
If dosent pick up tomorrow, Ill try sitting on 7073 or 7045 - I leave my system running when Im out for a while, so others can connect ARQ if wish. (also, I get to see who is about).

Cheers

2291. Port 8510 blocked

Yahoo group: V4Protocol
Date: 2011-09-30 16:17:56 UTC
From: jarhead65619
Topic: 2291 Message: 2291

I have encounted problems with all versions after 0.6.1.0 that indicate that port 8510 is blocked and auto update doesn't work. I did a complete new install with version 0.6.2.0 and did not enter my registration number. The program opened normally and the auto-update worked to 0.6.3.0 version. I entered my registration number and it immediately showed that port 8510 was blocked and the TNC was not available. Does someone have an answer as to why a registration number entry would block port 8510?

Ray,

Yes. A friend of mine recently had this problem. What he did is totally uninstall V4. He also went into the remaining V4 folders and deleted all folders and files. Then he then installed the latest V4 version. Apparently there was a file from a previous installation causing the problem. In any case, this fixed the problem.

Ray,
When it says the Port is blocked it is most usually that you have another instance of the TNC running. If they are setup to use the same port (e.g. They were launched with the same port code) there will be a conflict. Normally the V4 Chat takes full control of starting, checking for existing instances and shutting down the V4 TNC. but if you attempt or somehow start a second instance the port will be blocked. Since this is not happening with most users and I don’t see it here I suspect it is because you have launched a second instance or not killed an existing instance. You can use Task manager to check for instances (usually shown as the V4 TNC process). If you don’t launch the V4 TNC by itself (letting V4Chat do it) you shouldn’t have the problem.

Kirk,
While I am not familiar with the case you mentioned I do not believe that is the case. There is no file left after an uninstallation that can do that. When you erase or clear out the directories you eliminate your settings, Your registration key (if registered) your back up registration key, your log book etc. If you have a “port blocked” situation all that is really required is to find the instance that is already running and kill it or to simply reboot the computer if you don’t know how to kill an orphaned instance with the task manager.

Believe me I have been writing these TNCs (WINMOR and V4) for over 4 years and I do understand how they work and why a port gets blocked.

Thanks Rick, what you say is logical, however as long as I don't enter my registration number the program operates as it should. Entering the registration number, either on the nag screen or on the designated place, the program closes out and when it restarts the port is not available and the TNC is not displayed. BTW, I have looked for a second instance of the TNC and nothing is indicated. I am using 0.6.3.0 without entering the registration number and it is working great.

Ray, You have just described the exact problem that I just had. I send the Attachment of the error to Rick.

I was using v.0.6.3.0 and all was well. I got the same message that I was registered. Then the error sign with port 8510. It will NOT play even after a complete reboot of the system.

 I know what to do. you have to take out the resistration code in the .ini file and it will run as normal.

It is the registration process that is locking it up. Mabe Rick will read our comments.

Subject: RE: [V4Protocol] Port 8510 blocked

Ray,

Yes. A friend of mine recently had this problem. What he did is totally uninstall V4. He also went into the remaining V4 folders and deleted all folders and files. Then he then installed the latest V4 version. Apparently there was a file from a previous installation causing the problem. In any case, this fixed the problem.

73,

Kirk, K6KAR

Subject: [V4Protocol] Port 8510 blocked

I have encounted problems with all versions after 0.6.1.0 that indicate that port 8510 is blocked and auto update doesn't work. I did a complete new install with version 0.6.2.0 and did not enter my registration number. The program opened normally and the auto-update worked to 0.6.3.0 version. I entered my registration number and it immediately showed that port 8510 was blocked and the TNC was not available. Does someone have an answer as to why a registration number entry would block port 8510?

Rick

I too have seen this problem three or four times over recent releases.
After I realized what was happening, I have been very careful not to
launch the program more than once at a time, but an extra TNC process
seems to appear sometimes all by itself. Killing it with Task Manager as
you describe has always fixed the problem.

Running Windows XP + SP3 etc.

Thanks
Rick, what you say is logical, however as long as I don't enter my registration number the program operates as it should. Entering the registration number, either on the nag screen or on the designated place, the program closes out and when it restarts the port is not available and the TNC is not displayed. BTW, I have looked for a second instance of the TNC and nothing is indicated. I am using 0.6.3.0 without entering the registration number and it is working great.

Subject: Re: [V4Protocol] Port 8510 blocked

Ray,
When it says the Port is blocked it is most usually that you have another instance of the TNC running. If they are setup to use the same port (e.g. They were launched with the same port code) there will be a conflict. Normally the V4 Chat takes full control of starting, checking for existing instances and shutting down the V4 TNC. but if you attempt or somehow start a second instance the port will be blocked. Since this is not happening with most users and I don't see it here I suspect it is because you have launched a second instance or not killed an existing instance. You can use Task manager to check for instances (usually shown as the V4 TNC process). If you don't

launch the V4 TNC by itself (letting V4Chat do it) you shouldn’t have the problem.

Topic: 2291 Message: 2304

My V4 Chat auto registered this afternoon with the following start-up message:

*** Startup of V4Chat Ver 0.6.3.0 ; Auto Update Enabled using HTTP port 8776
*** Failure to open Command Port 8510 to V4 TNC.
Check and make sure port is unused.
*** Failure to open Open V4 TNC.

As it was working perfectly before the auto registration I tried going back to yesterdays 'old' .exe and .ini files with the same result.

I did a system restore to yesterday to get V4 to work correctly again.

Another point - the registration window says that a backup file has been saved to V4 TNC.ini.G3JFS. I searched the V4 files and my hard drive but cannot find this file or the registration key(which I did write down).

I launch V4 from a desk top shortcut and have never ever had a problem running it before the auto update kicked in. My Task Manager shows only one instance of V4 running.

My computer is a dual core Pentium with Windows XP Media Centre Edition SP3.

2307. Auto Registration / Port 8510 blocked

Yahoo group: V4Protocol
Date: 2011-10-02 11:10:21 UTC
From: John Wiseman
Topic: 2291 Message: 2307

I am sure there is a problem with the Auto Registration process, at least on my machine running Windows 7 Starter, with Outlook as email client.

What I did was:

Start V4TNC with a V4TNC.ini file not containing Registration= or Registration Email Sent= lines. Registration popup appeared. I entered my registration code, and the Auto Registration Thank you box appears. I closed the box, and the TNC also closed. The backup file wasn't created, and as far as I can see, no email was sent. There were no errors in the Exceptions log, and the Debug log contained:

2011/10/02 10:44:00.55 [0.6.3.0] New ARQ State: IRSWaitLeader

2011/10/02 10:44:00.57 [0.6.3.0] ClearSession 4

2011/10/02 10:44:01.94 [0.6.3.0] [StartCodec] Setting SelectedPlaybackDevice = Speakers (7- USB Audio CODEC)-e6

2011/10/02 10:44:02.83 [0.6.3.0] [StartCodec] Successful start of codec

2011/10/02 10:44:02.87 [0.6.3.0] ClearSession 4

2011/10/02 10:44:32.33 [0.6.3.0] [StopCodec] Stop thrNotify with blnSCCapturing = False

2011/10/02 10:44:33.35 [0.6.3.0] [StopCodec] blnInWaitThread = False, thrNotify ended.

2011/10/02 10:44:33.61 [0.6.3.0] [StopCodec] = True

I checked the .ini file, and the Registration= line was now present. Restarting the TNC give the "Email will be sent" popup. The TNC window did not appear, but the log indicated it had started. Again the TNC closed when I closed the popup.

2011/10/02 10:44:58.63 [0.6.3.0] New ARQ State: IRSWaitLeader

2011/10/02 10:44:58.68 [0.6.3.0] ClearSession 4

2011/10/02 10:45:07.05 [0.6.3.0] [StopCodec] Stop thrNotify with blnSCCapturing = False

2011/10/02 10:45:08.06 [0.6.3.0] [StopCodec] blnInWaitThread = False, thrNotify ended.

2011/10/02 10:45:08.42 [0.6.3.0] [StopCodec] = True

This repeated every time I tried to start the TNC, until I manually added a Registration Email Sent= line to the .ini file. Then the TNC started normally.

If I didn't enter my registration key, the TNC would run unregistered.

So, to sum up, the TNC seems to work if the registration lines are missing from the V4TNC.ini file, so long as I don't try to register.

If I have the Registration= line, but not the Registration Email Sent= line, the TNC will always close when I close the "email will be sent" popup.

73,

John G8BPQ

Topic: 2291 Message: 2308

Hi all,

Today I installed V4 Chat 0.6.3.0 on an old computer running XP SP3. On entering my registration key the registration process was carried out, the program ran as it should and the appropriate entries appeared in the .ini files. A minor problem was that the e-mail did not get sent because it wanted to use Outlook Express which is not set up on my computer.

Because this 'clean' installation of 0.6.3.0 worked perfectly on entering the Reg key it seems to me that something in the V4 program files on my shack computer has been upset during the course of installing the many updates since I started using the program.

2310. Trial Patch for V4 TNC.exe Version 0.6.3.3 uploaded

Yahoo group: V4Protocol
Date: 2011-10-03 19:34:07 UTC
From: kn6kb
Topic: 2310 Message: 2310

All,

This is a trial patch for test and comments. It should fix problems some have had with autoregistration and port problems on startup.

It also has some changes to reduce CPU loading primarily during searches while looking for V4 Signal. These appear to work fine here on the simulator and reduce the CPU loading a little less than half when the program is idle looking for a V4 signal.

To try this follow this:
DO NOT UNINSTALL THE CURRENT V4Chat version (0.6.3.0)

1) Make a backup version of your current V4 TNC.exe version 0.6.3.0 file.
2) Download the zip file V4 TNC 0.6.3.3
3) Unzip and place the V4 TNC.exe into your V4Chat directory.

Run your V4Chat as normal.

Please let me know if you have any problems with this version. If it checks out well I will put on autoupdate.

73,

Rick KN6KB

V4 TNC Revision History

Date Rev # Summary ofChanges

Oct 3, 2011 0.6.3.3 Test version to fix startup problems after auto registration (moved to tmrStartup thread)
The following were done to reduce CPU loading:
Modification of SearchforAMLeader47B2 to use FFT in place of Goertzel for initial tone search
In Protocol.ProcessNewCaputredData change inc during leader search from 1024 (1 symbol) to 2048 (2 symbols)
Move Envelope processing and filtering to after corellation in SeachforAMLeader47B2 and make it conditional on Correlation > than threshold.

Rick. After restart of the PC it report failure to open port 8510, and ask the Firewall for server privileges.

If waiting a loooong time a new windows pop up tells a permanent failure opening this 8510 port.

Clicking that warning away it opens ok, but does NOT shut down when closing Chat program.

Forcing shut down (in the Help menu) do shut down the task manager.

Next try opening the Firewall screams again, wanting being a server.
If accepting that firewall question the TNC opens ok.

AND NOW shut down normally when closing the V4Chat itself.

Now the Firewall IS open and next time both Chat and TNC opens without complaint. And shut down normally

This has for me been the issue also in 0.6.3.0 So no change here

I succesfully earlier got the registration issue, so that is never a problem, just the claim to the Firewall opening the port 8510 for server use. Every first time after rebooting the PC.

If I give it Server privileges, then it the TNC opens up.

I also expect that if I tell the firewall to PERMANENTLY give it server privileges on 8510 it will always start perfect after reboot.

Now the fun is to check for the enhanced QSO reading abilites.

Hope that helps somehow to begin with.....

”I also expect that if I tell the firewall to PERMANENTLY give it server privileges on 8510 it will always start perfect after reboot.”

Sure....that is the whole idea! If you are going to let the firewall pass the connection then create a permanent “rule” for this application.

There has to be a timeout (now 15 seconds) in V4 Chat that says ....if you can’t connect to the V4 TNC in this time then declare an error. Once the firewall is set up it should work every time.

Afternoon Rick

Per your instructions, I installed The V4 TNC revision 0.6.3.3 and it works only partially. Port 8510 is no longer blocked when the registration number is entered, but the TNC leaves the screen and is not visible when V4Chat is running. Removed the registration number from the .ini file and it is back on the screen and working as it should. Perhaps one more small tweak?

Ray,
The registration number has nothing to do with the port blocking. You shouldn't have to enter the registration key at all it should auto register if you have made the required number of ARQ connections. This is working for almost everyone else? I see MANY auto registrations emails come through.

I can't tell anything by your description. Clear out the V4Chat and V4 TNC logs and debug logs. Then start up V4Chat. Send me the V4Chat log, V4Chat exception log and V4 TNC Debug log and I will take a look.

Ray,

If it won't bind to the port there are usually only two things that can cause that:
1) The port is blocked by a firewall/router. I don't think this is the case
2) Another program (or stub of the Current program) is still running and has the port open.
Fix by:
a) Restarting Windows
b) Use the task manager. Look at Processes (sort alphabetical) look for V4 TNC as a running process and kill it using Task manager.

It should start correctly then.

To determine if a port is open by a Windows program, download TCPVIEW from the Sysinternals site. This program displays all running programs and the corresponding TCP/UDP ports that are open.

Hi. I have tried running both programs and waterfalls at the same time. See no problem. Leave V4 in FEC mode while running WINMOR. Stay in WL2K when V4 doing ARQ. 73 de la7um Finn

2327. Re: AW: [V4Protocol] Trial Patch for V4 TNC.exe Version 0.6.3.3 uploaded

Yahoo group: V4Protocol

From: Rick Muething
Topic: 2310 Message: 2327

The auto registration is for those that are truly “using or evaluating” the protocol and that requires a very small number of 10 ARQ connections. Remember there is no absolute need for registration...the program is free and does not expire...it just pops up the “donation suggestion nag” if unregistered. Those donations are what pay the bills (all programming and administration labor is volunteered) that cover real costs like software licensing, and development tools and test equipment. Auto registration will be closed when the first “production” release 1.0.0.0

2330. V4Chat 0.6.4.0 posted to Autoupdate server and Yahoo FTP server.

Yahoo group: V4Protocol
Date: 2011-10-05 19:09:11 UTC
From: kn6kb
Topic: 2330 Message: 2330

All,
I have posted a new autoupdate to clean up some issues with auto registration and CPU loading. The full install is available on the Yahoo FTP. The auto update has been posted to the auto update server.

For auto update to occur you must:
1) Have auto update enabled checked in your V4 Chat setup
2) Be connected to the internet
3) Have port 8776 open for HTTP transfer in your firewall or router
4) Be running version 0.5.2.0 or later of V4 Chat.
Auto update is checked approximately 2 minutes after startup or each 24 hours of continuous running.

You can of course use the full install posted on the Yahoo FTP site. Uninstall your previous version. DO NOT removed or edit any other files or directories. Install the new version contained in the zip file V4Chat 0.6.4.0 Full install.zip on the Yahoo FTP. No settings will be lost.

73,

Rick KN6KB

Changes implemented in this release:

V4 TNC Revision History

Date Rev # Summary ofChanges

Oct 5, 2011 0.6.4.0 Release of 0.6.3.4

Oct 3, 2011 0.6.3.4 Duplicate registration form launch removed from Interface.load

Oct 3, 2011 0.6.3.3 Test version to fix startup problems after auto registration (moved to tmrStartup thread)
The following were done to reduce CPU loading:
Modification of SearchforAMLeader47B2 to use FFT in place of Goertzel for initial tone search
In Protocol.ProcessNewCaputredData change inc during leader search from 1024 (1 symbol) to 2048 (2 symbols)
Move Envelope processing and filtering to after corellation in SeachforAMLeader47B2 and make it conditional on Correlation > than threshold.

V4 Chat Revision History

Date: Rev Change Summary

Oct 5, 2011 0.6.4.0 Release of 0.6.3.1

Oct 5, 2011 0.6.3.1 Modified Vertical Slider limits and Mini log auto column sizing.
Removed "FT0" command in Radio.ProcessKenwood to just insure Simplex using VF0 A
Remove "K590-Mic" option and change "K590-Aux" to "K590-Data" in Radio

Finn,

I have a big list to get to (not related to V4) the UTF-8 will have to wait a while. BUT you can help me by:
1) Finding out how to install the various UTF-8 character sets on a PC.
2) Sending me some sample text via email using those fonts (probably as an attachment).
3) There is some special things that have to be done in V4 since it is not permissible to bridge a frame with a multi byte character (UTF-8 characters can be multi byte)

Paul,

Rule #1....Details are all that counts and unless I see the details in the V4 TNC debug log with a pointer (from you) to the approximate UTC time I can’t do anything. There is also a useful session summary which is sometimes important in the V4Chat log.

If you have questions read about the logs in the V4Chat help. Send the logs to me directly (not through the reflector) as attachments.

Ok Rick. I am the biggest PC idiot in our LA3F group, but there are some good PC (WINDWOWS and LINUX guys.) I may ask around getting help.
But first a hands on RMS Expr workshop in Oslo next monday (12 days).

Utf-8 can wait.

We could put the 8bit ascii codes according to different standards, an make a printout also as PDF so you really see how it looks.

My LINUX "guru" recently did sendt various texts to me to my WINLINK account from Gmail and from a self generated UTF-8 text, I returned it and it showed well up on his screeen.

But I also took a PDF print out of how it _looked_ in RMS Express, and then he understood how it looked gibberish, but the necessary information was kept so it "looked" correct again after forwarding the text back to sender Shown in Gmail by Firefox set at UNICODE (UTF-8).

We have found some "name mix ups" UNICODE, UNICODE (UTF-8), UTF-8.
A kind of Chaos. And "statistical Guess works" within some systems.

It "guesses" correct if you write NORMAL text with implemented the scandinavian or german Umlauts, and probably also the french, spanish and italian.

But it fails if we just send a sequence of only a lot of those EU special letters not implemted in normal WORDS.

You probably must tell that the standard is UTF-8 BASTA!!!as in italian.

No guess works.

One way for the client might be , by choice, Skip UTF-8 and stick to 7bit ascii getting a higher throughput and Write Nato Norwegian.

Or Choose UTF-8 and live with the corresponding slower throughput.......I guess....no pc guy.......

Now bed....You have got a generall issue presented in the Winlink_Programs_Group by me.

The fix of that, or a clear explanation is more important :-)

2341. V4Chat Version 0.6.4.0 . Problem with ICOM Radios' filter setting

Yahoo group: V4Protocol
Date: 2011-10-06 00:46:35 UTC
From: ham
Topic: 2341 Message: 2341

Rick and Co:

Has anyone else run into a small issue where the Radio Filter setting is set to MID (filter number 2) when V4 Chat is configured to control an ICOM radio?

The problem also occurs when clicking on the waterfall.

I am having the issue with the ICOM IC-746PRO. Perhaps the issue is specific with only this particular model of the ICOM radio?

BTW, version 0.6.4.0 updated perfectly and now the registration key is in the V4TNC.ini file along with the correct E-mail flag.

Bernie,
The mode is set to USB digital. I know from work in the past with other programs using a similar radio driver that the Icom 746 can be a problem automatically changing the filter when the mode is changed. This can be fixed but the Icom documentation is very unclear (and tests done previously on the other project confirmed this) about what the command sequence should be. It will have to wait until I can borrow and Icom 746 for a few days to try and determine what special code I need to insert to work around this issue. I do seem to recall that the problem was was unique to the 746.

I wish the Japanese radio mfg were as good with their documentation as their radios!

73,

Rick., KN6KB

Thank you Rick for the explanation. I did send you a serial line trace via E-mail about 1 week ago showing the problem. The issue appears to be related to an extra byte in the sub-command field when the mode of the radio is set. The documentation in the ICOM 746PRO manual is pretty fuzzy regarding the packet format of the sub-command field.

This problem is a very low priority one.

If you need someone to Beta test the change, just drop me an E-mail

Hello,

It is not a problem in the non-Pro version of the 746. I set mine up for plain old USB in the V4 setup screen and that is where it goes without any problem.

So this must be specific to the 746PRO.

Thanks Bernie,
Yes I looked over your prior comments as I poured over the Icom docs. I'm working on getting a 746 Pro loaner to play with. I know from the past that the trial and error method using remote debugging is not too productive with this kind of problem.

From: Peter
Topic: 43 Message: 2349

Hi Rick,

my shack computer which suffers with the blocked port on registration problem auto updated from 0.6.3.0 to 0.6.4.0. earlier today. On entering my registration key in 0.6.4.0 the blocked port message is gone but the TNC window disappears as soon as the key is entered. The program will work only when the registration key is removed from the .ini file.

On another machine where I had installed a new copy of 0.6.3.0 that had auto registered correctly, the auto update to 0.6.4.0 worked without any problems.

Peter,

Run ONLY version 0.6.4.0 If it isn't registered and you have made the required number of ARQ connections then send me the V4 TNC.ini file and I will look at it. Virtually all the problems to date have been people trying to enter registration codes incorrectly. If the conditions are correct the registration should be automatic. Send me the V4 TNC.ini file and I will take a look.

Registration has nothing to do with blocked ports. If the port is truly blocked it will not run the V4 TNC. This has always been the case from the very first beta.

2352. V4 and WINMOR TNCs

Yahoo group: V4Protocol
Date: 2011-10-06 13:16:45 UTC
From: David Bastress
Topic: 2330 Message: 2352

GM Rick,

Any chance we can get you to take a look at both the V4 and WINMOR TNC's waterfall and constellation box code and see if there is some relatively easy way to code them so that the center frequency and cross hair centers stay in the center of their respective displays when you change font sizes?

Alternately and maybe easier to do, is to allow us to change the font size within the RX and TX text boxes without affecting the font size of other parts of the program GUIs or having to make a universal text size change via Windows like we have to now if we want a larger font size.

Old eyes will thank you!

I have just updated my TS-590S digital HOWTO to version 1.1.

The original document has been much expanded, and now includes:

-- details of the USB, COM and ACC2 ports
-- new section on setting baudrates
-- extended menu settings to include ACC2 settings

As usual, if you spot any errors, please let me know.

To get the document, go to:

http://homepage.ntlworld.com/wadei/ts-590s.htm

and click on the "HOWTO set up the Kenwood TS-590S for Digital Data and
Digital Voice Operation" link.

Yahoo group: V4Protocol
Date: 2011-10-06 19:42:35 UTC
From: Rick Muething
Topic: 2330 Message: 2354

Dave,
It isn't easy to change/scale the waterfall or constellation plots without getting aliasing on the waterfall since there is a close relationship between frequency bins of the FFT and pixels.

Certainly it is possible to allow re positioning of labels and to allow changes in font size on the text boxes. The problem is unfortunately more basic than that.

Vic Poor (the most productive and skilled programmer in the Winlink team) is planning some extended vacations including a 1 year RV trip. That means the rest of us are left with the Client programs (V4Chat, RMS Express, Paclink, the Server programs (RMS WINMOR, RMS Pactor, RMS Packet, RMS Robust Packet, RMS Trimode) and a slew of CMS programs (ones you never see but are what makes all the email and other functionality of the Winlink 2000 system work).

So I just don't know where the resources are going to come from.

I will look at the font selection for the main text boxes...that might not be too bad as long as the sizes support all the font styles (bold, italic, strikethrough etc.) that are used.

2359. Connect situation

Yahoo group: V4Protocol
Date: 2011-10-06 22:09:35 UTC
From: John Hirth
Topic: 2359 Message: 2359

I came upon an interesting situation this evening.

After calling CQ in ARQ, I was called by NY3J, who was pretty weak here.
I acknowledged his first call (program showed COnnected to NY3J), but
obviously he didn't hear my ACK. His connect frames continued, buy my
end just sat quietly, never sending another ACK to the connect request,
until he eventually timed out and sent his CW ID.

Is this as intended? It would seem to me that had my end sent ACKs to
each of his Connect frames, even though my end thought we were
connected, he might have well caught one one of the ACKs and our QSO
could have proceeded.

Just an observation, and I guess, a question.

Hi John,

I may not have been in zero beat exactly with your station because I clicked on your signal to connect with you and your signal was weak. I also thought it was unusual that we connected but I didn't hear any other data streams until I timed out. I am using 0.6.4.0.

John,

Your end will send an ACK to ANY connect frame targeted to your station. A connect frame is just a data frame of a particular format. But if you do not decode a successful connect frame you will not answer. None of this has changed in the protocol in the last 10 or so revisions.

2362. Re: [V4Protocol] V4Chat Version 0.6.4.0 . Problem with ICOM Radios' filter setting

Yahoo group: V4Protocol
Date: 2011-10-06 22:18:19 UTC
From: John Hirth
Topic: 2341 Message: 2362

This filter selection change by V4Chat is not only a problem with the IC-746Pro.

On my IC-7200 when I already have the Narrow filter selected (which I run most of the time), the filter selection changes to Wide when V4Chat starts or whenever you click on a log entry.

The same happens on my IC-7000, but V4Chat forces the radio to Filter 2.

For what it's worth, RMS Express does the same thing. I wrote this up as a problem when we were first Beta testing /WINMOR/RMS Express.

I'd really prefer not having the programs change my filter selection, but if it's sizable programming job I can live with constantly re-selecting my intended filter.

Topic: 2355 Message: 2363

Ron, All,

Trying to guess about decoding efficiency is impossible. There are several factors affecting decoding including signal Strength, multi path distortion, burst errors, etc. The score is a reasonable average of all the symbols in a frame but it alone does not insure a successful decode.

If the debug log is enabled there is some additional details captured (e.g. sync decode distance) which are useful to the trained observer. There were no significant changes in the decoding but I would have to look at the debug log to tell more details.

I've also been noticing repeats on a good signal which I was wondering about. I can't be sure that it's not propagation and qsb on either station.

Ron ny3j

Does anyone else have more repeats after upgrading to version 0.6.4.0.
I am getting a lot of repeats after upgrading with scores of 96 – 100 and S/N of 35 – 40. I expect signals that good to have very few repeats. This is happening on both receive and transmit.

Yes,same here. I had the feeling that something unintended had happened to the TNC in the 0640 release. In highly scientific terms, "it doesn't seem to hear as well".

Ron,
getting exactly on frequency is not important. If your capture range (set in setup) is say 100 Hz then anything within that 100 Hz will decode the same. The DSP code automatically determines the frequency to about 1 Hz with every frame based on its leader.

Subject: Re: [V4Protocol] Connect situation

Hi John,

I may not have been in zero beat exactly with your station because I clicked on your signal to connect with you and your signal was weak. I also thought it was unusual that we connected but I didn't hear any other data streams until I timed out. I am using 0.6.4.0.

Ron ny3j

On 10/06/2011 06:09 PM, John Hirth wrote:

I came upon an interesting situation this evening.

After calling CQ in ARQ, I was called by NY3J, who was pretty weak here.
I acknowledged his first call (program showed COnnected to NY3J), but
obviously he didn't hear my ACK. His connect frames continued, buy my
end just sat quietly, never sending another ACK to the connect request,
until he eventually timed out and sent his CW ID.

Is this as intended? It would seem to me that had my end sent ACKs to
each of his Connect frames, even though my end thought we were
connected, he might have well caught one one of the ACKs and our QSO
could have proceeded.

Just an observation, and I guess, a question.

Subject: [V4Protocol] V4Chat 0.6.4.0 posted to Autoupdate server and Yahoo FTP server.

All,
I have posted a new autoupdate to clean up some issues with auto registration and CPU loading. The full install is available on the Yahoo FTP. The auto update has been posted to the auto update server.

For auto update to occur you must:
1) Have auto update enabled checked in your V4 Chat setup
2) Be connected to the internet
3) Have port 8776 open for HTTP transfer in your firewall or router
4) Be running version 0.5.2.0 or later of V4 Chat.
Auto update is checked approximately 2 minutes after startup or each 24 hours of continuous running.

You can of course use the full install posted on the Yahoo FTP site. Uninstall your previous version. DO NOT removed or edit any other files or directories. Install the new version contained in the zip file V4Chat 0.6.4.0 Full install.zip on the Yahoo FTP. No settings will be lost.

73,

Rick KN6KB

Changes implemented in this release:

V4 TNC Revision History

Date Rev # Summary ofChanges

Oct 5, 2011 0.6.4.0 Release of 0.6.3.4

Oct 3, 2011 0.6.3.4 Duplicate registration form launch removed from Interface.load

Oct 3, 2011 0.6.3.3 Test version to fix startup problems after auto registration (moved to tmrStartup thread)
The following were done to reduce CPU loading:
Modification of SearchforAMLeader47B2 to use FFT in place of Goertzel for initial tone search
In Protocol.ProcessNewCaputredData change inc during leader search from 1024 (1 symbol) to 2048 (2 symbols)
Move Envelope processing and filtering to after corellation in SeachforAMLeader47B2 and make it conditional on Correlation > than threshold.

V4 Chat Revision History

Date: Rev Change Summary

Oct 5, 2011 0.6.4.0 Release of 0.6.3.1

Oct 5, 2011 0.6.3.1 Modified Vertical Slider limits and Mini log auto column sizing.
Removed "FT0" command in Radio.ProcessKenwood to just insure Simplex using VF0 A
Remove "K590-Mic" option and change "K590-Aux" to "K590-Data" in Radio

2370. V4Chat and V4 TNC auto 0.6.5.0 posted to auto update and Yahoo FTP

Yahoo group: V4Protocol
Date: 2011-10-07 16:04:16 UTC
From: kn6kb
Topic: 2370 Message: 2370

All,
I did some extensive testing yesterday and today and found that last TNC change (0.6.3.0 > 0.6.4.0) did decrease the sensitivity (a result of my attempt to decrease CPU loading). This new release fixes that and in fact improves the sensitivity about 8% over the prior 0.6.3.0 rev. I added some special code to back off the CPU loading if the V4 TNC is Idle (hasn't seen a sync in 15 seconds. But restore full sensitivity upon detection of a sync.

Also per request of several users V4 Chat now allows (in the Setup menu) the selction of Font size for the Keyboard and Session text boxes and the mini log grid. The default font is 11 point (slightly larger than prior revs but the range of selection is 8 point (very tiny) to 15 point (very large) so this should accomodate virtually all users and preferences.

As usual if auto update doesn't work for you the full install can be downloaded from the Yahoo FTP site.
73,

Rick KN6KB

V4 TNC Revision History

Date Rev # Summary ofChanges

Oct 7, 2011 0.6.5.0 Release of 0.6.4.1

Oct 7, 2011 0.6.4.1 Change type font on Center frequency label and main menu line to 10 point (was 9)
Modify Protocol.ProcessNewCapturedData to switch leader search increment from 2048 to 512 when within 15 sec of last sync detect (improves sensitivity but keeps IDL CPU loading low)
Modify SearchForAMLeader47B2 to only busy detect every 93 ms
Put email of registration data inside Try/Catch in case no default mail client.

V4 Chat Revision History

Date: Rev Change Summary

Oct 7, 2011 0.6.5.0 Release of 0.6.4.2

Oct 7, 2011 0.6.4.2 Modified font selection to 8-15 point in 1 point increments, default = 11.
Defaulted main form menu line to 11 point type (was 10)
Updated V4Chat help

Oct 6, 2011 0.6.4.1 Add selectable font size (8,10,12,14) on V4Chat text boxes and mini log grid.

2375. AW: [V4Protocol] V4Chat and V4 TNC auto 0.6.5.0 posted to auto update and Yahoo FTP

Yahoo group: V4Protocol
Date: 2011-10-07 17:09:13 UTC
From: Siegfried Jackstien
Topic: 2370 Message: 2375

I have a question to the idle state
Is the sync easier to detect so that while sitting standby on a channel you
can get all stations (even weak ones) ???

You wrote you improved sensitivity ... but also after back off of cpu load??
Otherwise maybe you could make that idle mode user selectale (dx mode or so)

So the user could lower cpu load if he wants to ... but can let the soft on
full sensitivity with a faster cpu (no need to switch to idle mode then)

Greetz
Sigi

Ps update worked fine here :-)

Rick,

The sensitivity is improved considerably. Just had a QSO without hardly any repeats. Now I have to learn how to type faster to keep up with the throughput :-)

Thanks for the fix. The speed is much inproved with far fewer repeats. I could type faster than version 0.6.4.0 but not after the auto upgrade to version 0.6.5.0. Great job

>
> All,
> I did some extensive testing yesterday and today and found that last TNC change (0.6.3.0
> 0.6.4.0) did decrease the sensitivity (a result of my attempt to decrease CPU loading). This new release fixes that and in fact improves the sensitivity about 8% over the prior 0.6.3.0 rev. I added some special code to back off the CPU loading if the V4 TNC is Idle (hasn't seen a sync in 15 seconds. But restore full sensitivity upon detection of a sync.

Sigi,

A good question...Well I could put user selectable options for just about everything but it gets messy and causes more confusion. For example this last release reduces the retries for leader detection by a factor of about 4:1 if there is no Sync detected in 15 seconds. That translates to a change from about a 97% leader detection rate to about a 65% leader detection rate on a poor channel such as multipath poor at −5dB S/N when using the same threshold value of 5. For better channels the difference is less. This reduces the CPU loading while searching by about a factor of 3 or so. But as soon as a sync is detected it switches to the more sensitive mode. But because you are not sitting there long searching for the leader signal the average CPU loading remains fairly low. It really won’t impact the ability to connect with a weak distant station since the connect requests are always repeated. Missing one or even 2 or 3 is not a problem.

The user still has threshold control allowing shifting the leader detection threshold up or down just as before. For very weak signal work this can be reduced to values like 3 or 4 and will increase the sensitivity and CPU loading somewhat.

Ok Rick thank you for that good explanation ... I just thought that I could "loose" a call from a distant station if the soft is in idle ... but you are correct the cq calls are repeated several times ... and if you have just one detect the soft switches to high sensitivity ... ok on that :-)
Congrats for such a great work ...

Rick

Just to confirm that your changes to 0.6.5.0 did make the decode sensitivity better. I upgraded while listening to a QSO in progress and did notice an improvement in the number of error free frames decoded.

After the upgrade, I worked an OH7 with poor band conditions.

New fonts feature work great. Thank you!

An chance of storing the mini-log in ADIF format or an export log facility?

Other than the missing export facility, I would deem V4 Chat ready for general release. Excellent job Rick !!

Sigi,

Many thanks again for my first V4 QSO - using V0.6.5.0. You have helped me a lot in my first ARQ mode. On checking back through my log it is obvious that I have a few details to attend to - like typing with the CAPS lock ON! And typing my callsign at the beginning of a sentence - which meant that my callsign was transmitted twice!! However, I now understand much more of the software and the procedures.

Some observations:

1. When I signed off with you and sent my CW ident at 12:17:24 I heard your CW ident a short time later. However, at 12:17:56 my log says: "CONNECTED TO LA3RIA". I had been called for lunch and could not answer LA3RIA - unfortunately.
2. I also noticed later that several lines of text were still in my IN buffer but on checking the log this same text had already been transmitted. I will watch out for this on the next QSO.

Bernie,
Thanks for the feedback. Yes I ran 30 minutes on the simulator each configuration with various settings and those tests showed about an 8% improvement over the earlier 0.6.3.0 version and a significant improvement over 0.6.4.0.

I will look into the ADIF format and Export utility to save the mini grid log. That would be a worthwhile addition.

Rick,

tnx once more, I´m vy pleased with V4. In my view, it fills a gap by making arq accessible while restricting bw to a justifiable minimum.

I read that you will look into ADIF export, which would be a boon to users of log programs.

May I deposit two more feature requests (category: strictly nice to have, no show stoppers):

1) an editable (dropdown?) list of frequencies to enable rapid qsy with a click (at present, as a workaround, I click into a suitable freq entry of the minilog, which becomes cumbersome when much scrolling is required)
2) as an adjunct to 1) a frequ increment/decrement button (250Hz steps)

Rick,

The help explains the scroll lock function, why and how it works. It happens any time you scroll the session window (so incoming data will not “unscroll”. It will turn off by clicking the scroll lock or in 30 seconds by itself...Again all explained in the help.

From: Jack Swift
Topic: 2395 Message: 2395

3. Keyboard Entry rich text box:
"Any data in the Keyboard text box in blue italic type may be edited"
"The Send Command leaves prior sent data in the Keyboard entry box but changes it to dark gray which can no longer be edited."

the difference between "blue italic" and "dark gray" is somewhat difficult for me to distinguish - especially when i'm a newbie starting a chat and there's only one color in the entry box.

one of 'the other programs' puts a red line through text which has been sent/queued.

i'll get better at it, i suppose.. there's a learning curve and i'm at the bottom.

2396. V4 Trouble on Old ICOM 706

Yahoo group: V4Protocol
Date: 2011-10-09 16:00:37 UTC
From: rapidan2011
Topic: 2396 Message: 2396

I need some assistance with the TNC and radio settings in V4.
My computer is a Toshiba dual core laptop running WIN 7 64 bit.
The radio is a ICOM 706 (old model) which I have succesfully interfaced with HRD and MultiPSK
The interface is a Digi ICOM CAT/CV-I serial port product made by xggcomms.com in England. I have successfully used this interface with HRD and MultiPSK and a few other digi programs and logging programs.
I use an external USB sound card which shows as COM 3 with audio cables connecting to the Interface. The interface is connected to a computer USB which shows as COM 4. A CV-I cable from the interface is connected to the ICOM 706 CV-I connector.
In V4 Set Up
TNC: The capture device is selected to be the microphone on the USB sound card, The play back device is selected to be the USB sound card speaker output.
Radio Settings: Radio Control Port = Com 4, PTT Control Port = CV-I...these settings allow the 706 to set and control frequency, but it will not key the transmitter
If I set Radio Control Port = COM 3 RTS enabled, PTT control Port= Com 4 DTS enable or RTS enabled the radio keys and transmitts immediately without control.
Any assistance or ideas will be appreciated.

Ted, WB2LOU

If I remember correctly, the 706 does not do PTT by way of a CAT command. I think you will need to run PTT using VOX.

Does your hardware support keying by VOX?

Jack,
If you look at the details of the Main form (in the help) you'll see that there are several colors and type fonts used. For example red strikethrough text is used in the Session window to indicate FEC data received but that cannot be corrected (exceeds the FEC capability), Black bold text indicated ARQ data received and is fully corrected, Purple text is status etc.

The fonts colors used are all in the help and designed to be different and distinct so not to add to confusion. By leaving the sent text in the keyboard box as dark gray it allows you to see easily in one spot all the text that was typed but distinguishes it from new text (blue italic) which has yet to be sent to the outbound buffer.

Hi Rick,

I use .txt files for "Name, QTH, Rig, Weather, etc" To reduce wear and tear on the keyboard Hi Hi.
One has the "Name, QTH, rig and antenna". The second has the "weather". I don't change anything in the
first file but do change the temperature and weather conditions in the second. I noticed that if I append
the two files in the text entry box the second one does not see the CR at the end of the first one. I realize
that a CR can be used to move the contents of the keyboard text window to the chat window. Is it possible
to use some other key stroke to enter a CR ???. Just my two cents.

Thanks & 73,
Fred, W1WYC

3. Keyboard Entry rich text box:
"Any data in the Keyboard text box in blue italic type may be edited"
"The Send Command leaves prior sent data in the Keyboard entry box but
changes it to dark gray which can no longer be edited."

the difference between "blue italic" and "dark gray" is somewhat
difficult for me to distinguish - especially when i'm a newbie
starting a chat and there's only one color in the entry box.

one of 'the other programs' puts a red line through text which has
been sent/queued.

i'll get better at it, i suppose.. there's a learning curve and i'm
at the bottom.

i understand the problem with so many different texts and so few colors <G>...
i suspect that one of the problems i'm seeing is that ALL text in the
keyboard box is italicized... perhaps if the queued text was bold-ed
or un-italicized it might help.

From: Rick Muething
Topic: 2396 Message: 2401

Ted,

There are several parts to setting the radio interface.

1) Selecting the correct sound card devices (more accurately playback device and capture device...some sound “cards” call them by different names).
2) Setting a PTT mode that is compatible with your radios/setup AND ALSO meets the minimum latency requirements of V4. Since V4 is ARQ and requires rapid Transmit to Receive switchover it may not be compatible with all sound card interface or radio interface hardware. (e.g. if your radio interface added excessive delay to the PTT it will cause too much latency). The four options are described in the help. All will work and which you select is a matter of choice and what your radio and/or sound card interface supports.
a) VOX using the radio’s VOX circuitry (Make sure VOX delay and Hold are set to minimum)
b) Sound card “VOX” where the sound card keys the PTT line based on detection of audio (e.g. like the SignaLink USB ... set DLY fully CCW on the SignaLink)
c) Direct PTT keying using a dedicated serial port and the RTS or DTR signals. (may require level shifting or a relay depending on serial interface and radio)
d) “CAT” PTT keying using a Transmit or Receive command to the radio. Not all radios support this and I am not sure but I don’t believe the early 706 does...look at your 706 manual to see if it supports the TX commands.
3) Setting the Transmit level drive. Depending on the sound card, driver and interface this may use pots, jumpers and or the Windows mixer. See the help.
Use the two tone test to set the level to NO MORE than 70% of the Rated PEP when using a average reading watt meter. Most radios will show no ALC at this point (though many Icom’s always show some ALC)
4) Setting the Receive audio level. Depending on the sound card, driver and interface this may use pots, jumpers and or the Windows mixer. See the help.
You want the level toward the middle of the green level band if possible.

When you think you are finally set up make a ARQ CQ and look at the measured latency ...it must be < 250 ms. If not you’ll have to select an alternative Keying method in 2) above.

Remember V4 unlike many sound card modes is ARQ so that requires careful attention to and implementation of PTT control and timing that you can usually ignore for other modes.

Subject: [V4Protocol] V4 Trouble on Old ICOM 706

I need some assistance with the TNC and radio settings in V4.
My computer is a Toshiba dual core laptop running WIN 7 64 bit.
The radio is a ICOM 706 (old model) which I have succesfully interfaced with HRD and MultiPSK
The interface is a Digi ICOM CAT/CV-I serial port product made by xggcomms.com in England.

I have successfully used this interface with HRD and MultiPSK and a few other digi programs and logging programs.
I use an external USB sound card which shows as COM 3 with audio cables connecting to the Interface. The interface is connected to a computer USB which shows as COM 4. A CV-I cable from the interface is connected to the ICOM 706 CV-I connector.
In V4 Set Up
TNC: The capture device is selected to be the microphone on the USB sound card, The play back device is selected to be the USB sound card speaker output.
Radio Settings: Radio Control Port = Com 4, PTT Control Port = CV-I...these settings allow the 706 to set and control frequency, but it will not key the transmitter
If I set Radio Control Port = COM 3 RTS enabled, PTT control Port= Com 4 DTS enable or RTS enabled the radio keys and transmitts immediately without control.
Any assistance or ideas will be appreciated.

Fred,

There are 3 keystroke options to move the entered text to the outbound buffer and they are selected in the V4 setup and described in the help. They have all been there the last 2 months or so. I don’t want to complicate it any further by adding more options.

Jack,

It is not desirable and more confusing to alter a text font when moving it from the keyboard text box to the session text box. The session text box supports more colors and fonts (including italic, bold, strikethrough and 5 colors). The program won't let you go back and edit gray text in the keyboard window anyway... it is there only to allow you to quickly see in one spot (without the intermixed in and outbound text in the session window) all the text you have typed. Blue italic text is editable before being sent to the outbound queue. Its been this way about the last month or more and there have been no complaints....When it comes to colors and fonts you can never please all the people all the time but I think keeping them constant in the implementation is less confusing than giving the user unlimited options....its hard enough to write the help and get anyone to read it now!!!

ok, NOW i understand - the entire text window is really one 'system'
and you copy the text from entry to session - and changing font
within/during the copy is cumbersome and could introduce
inconsistencies. every line/variable of new code could interfere with
a line/variable of previously written code. (is the base code old
enough to be called 'legacy'? <G>)

i can/will deal with it... i've got enough problems with my spelling
errors that the 'similar' colors are a minor issie.

From: Ted Trostle
Topic: 2396 Message: 2405

I can easily make the 706 key and transmit by setting the Radio Control Port to COM 3, RTS and PTT Port to COM 4, RTS with a latency of about 56.

Doing so seems to disable the freq CV-I control and I have to manually set the frequency.. I seem to remember at an earlier time, this was not a problem. If I can find a older V4 version I may just uninstall, delete, clean out the registry, etc go back to see.

Ted,
I don't think anything has changed in the radio control to affect that. The only changes have been in the Radio frequency read back and support for radios with built in sound cards like the IC7200/7600 and Kenwood TS590. If you are using two different Com ports (one for radio control and one for keying) that should not be a problem.

Maybe someone with an older 706 (Pre Mark II) can comment?

Hi Ed,

Good chatting with you again. The QRM was an IK4 station using Olivia 32/1000, that mode takes a lot of bandwidth compared to what V4 uses. I was monitoring it on the other computer. V4 Chat held up pretty well with 1/2 of it's bandwidth being taken.

Still trying to figure out how to filter out those local QRM signals, :-)

2409. V4 Ver. 0.6.5.0

Yahoo group: V4Protocol

From: k1dow_4
Topic: 2409 Message: 2409

Rick,

I've been meaning to get a note off to you to thank you for a much improved version 0.6.5.0 of V4

I do note a minor thing that you may want to look at which probably has been there right along, but which I became aware of today.

If I have been back scrolling in the RX window and then return the cursor to the TX window, the scroll lock remains on until it times out. Then the cursor jumps back up into the RX window. Would it not be better to have the scroll lock turn off as soon as you manually place the cursor back in the TX window when you are done back scrolling?

2410. Re: [V4Protocol] V4 Trouble on Old ICOM 706

Yahoo group: V4Protocol
Date: 2011-10-10 05:53:50 UTC
From: Paul Whitaker
Topic: 2396 Message: 2410

Hi Ted,
Im using the IC706 older version.
I operate HRD, Ham Radio Integrator, WL2K, and V4 all successfully.
I also operate HRD in remote mode over WiFi network- which was a challenge, but works well with IPSound software.

The 706 has a limited number of functions on CAT control, and as someone else pointed out, PTT is not one of them.
If you check out the Ham Radio Deluxe help file, there is some good info. about interfaces. That is what I based mine on.
I use a 4N25 optocoupler for PTT, a MAX232 for CAT level shifting, and 2 small 1:1 600 ohm audio transformers for audio isolation.
My V4 latency is usually around 50. Also, I have to date not bothered with an external soundcard (BAD say many), but use the Mic & Ear sockets on my laptop. I had some noise feeding back to the receiver from the operation of the trackpad, but properly shielding the interface totally fixed that.
I cant comment on other issues with onboard soundcard - but I purchased a soundcard USB dongle for $19, but havent got around to comparing.
You could also fhrow on some HF rated ferrite clipons for good measure - I use them with Pactor 3, but as yet, havent seen the need on V4 & the others.
See Airmail help for more info on ferrites.

As for settings in V4Chat: Radio Setup...
Icom Amateur Radios.
48
USB

RADIO CONTROL PORT:
Com 13, 9600, Enable RTS, Enable DTR

PTT PORT (optional):
Com 13, 9600 is greyed out, Enable RTS, Enable DTR

A warning about same serial port appears, but continue. Should all work then. Of course, your radio address might not be 48, and you might not be on Com 13.

Good luck, and check out the HRD help file - good information.

Cheers

2413. Rick, Another suggestion...

Yahoo group: V4Protocol
Date: 2011-10-10 12:53:28 UTC
From: Paul Whitaker
Topic: 2396 Message: 2413

Hi Rick,
0.6.5.0 Looking good !
Had a very casual contact tonight with VK3IFM. V4 is maturing well.

I have all the suggested frequencies entered into the mini log on the left.
Quick way to change bands etc.
I had one thought, if the interface could switch / scan the entries, with
some delay (say 1 min (adjustable ?),
and stop if signal received, resume if no more signal, it would be an
interesting feature, and valuable for monitoring purposes.

Just a thought. You have done so much already, hate to ask...

Thanks

Paul Whitaker.
VK3DPW.

While it works very well on V4, now I now need to get the 706 running on
WINMOR RMS Express the same way.

2416. More Kudos for 6.5.0

Yahoo group: V4Protocol
Date: 2011-10-10 14:37:04 UTC
From: ei5ds
Topic: 2370 Message: 2416

Hi Rick,

Loaded the latest version 6.5.0 on return from 2 weeks holidays in the south of France.

Noted an improvement over the previous version 6.3.0. Enjoyed some excellent QSO's with both DX and local EU stations over the weekend. Link was solid even with weak signals.

Look forward to further improvements in the 'Logger' facility.

From: EUGENE
Topic: 2417 Message: 2417

Rick,
A small detail, but an observation - it may have been mentioned before.

In my mini-log I keep a list of all the current frequencies in use.
On several occasions I note that when I want to update some of the information in the "Add/Edit Contact" pane - on pressing "Edit Contact" the blue highlight bar in the mini-log jumps to a different frequency.
However, the actual rig frequency remains the same as before the edit.

Has anyone else noticed this - or is it my system?
Win XP Home SP3 - FT847 - WM Rigblaster Plus.

Rick

Auto-update from 0.6.3.0 to 0.6.5.0 was smooth as silk. V4 is looking
better than ever. Many thanks for all you have done.

2421. Trial ADIF Log file comments

Yahoo group: V4Protocol
Date: 2011-10-11 14:27:16 UTC
From: kn6kb
Topic: 2421 Message: 2421

All,

I am working on the addition of automatic ADIF format QSO logging for V4 Chat. I have the basics of this working and there is a small sample file
V4Chat_ADIF_KN6KB.adi on the FTP. This currently logs only ARQ Calls and connected QSOs including call sign, date, start and stop times UTC,
band, frequency and short comment indicating V4 ARQ Call or V4 ARQ QSO.

Questions and comments?

1) Do we need to log FEC transmissions? If so what is the Start/stop?
2) Any other data readily available need to be logged? I would rather this be as automatic as possible without the need for the operator to enter anything. Currently all the data above is automatically logged.
3) Does it (Should it) tie into the minilog or not?
4) Is the format OK (at least it was read OK by ADIFMaster!)
5) Currently there is no mode standard for V4...I just used "V4". Is there someone/web site to enter the mode "V4" into some approved list?

I would appreciate your feedback. This was pretty simple and should be in the next release.

73,

Rick KN6KB

2422. Re: Trial ADIF Log file comments

Yahoo group: V4Protocol
Date: 2011-10-11 15:05:44 UTC
From: ham
Topic: 2421 Message: 2422

Hi Rick:

I loaded the test ADIF file into MIXW, Ham Radio Deluxe and DX Keeper with no problems. These programs were happy with the use of V4 as the mode.

At the present time, uploading to LOTW and eql.cc will require the use of a mapping function for the mode. One eqsl.cc QSL I received, used HFSK which is not really defined but appears to be in the ADIF specification.

Ideally, there should be a way to log FEC transmissions.

I am unaware of how to get V4 onto the "approved list" of ADIF modes.
Perhaps someone out there knows what needs to be done?

Rick,

1) Do we need to log FEC transmissions? If so what is the Start/stop?
It would be nice if we had the ability to do this as it may ply nice if V4 is used in the "Ecomm" scene.
3) Does it (Should it) tie into the minilog or not?
Yes Please.....

Again thank you for all of the time and efforts on this,I am sure that many will share the same sentiment.

Rick,

The test ADIF file loaded into MixW and TurboLog 4 with no difficulty whatsoever - Logger32 accepted the ADIF file saying " 2 QSO's Read" but I cannot find the 2 QSO's in my log, even after a computer restart. I will continue checking in slow time.

Eugene,
You don't have the software version yet that creates the log! I wanted to make sure my syntax was correct before posting an update. It will be a few days before I get it posted. I still have to clean up some details like how to log the FEC transmission, integrate with the mini log etc.

From: Peter Zingsheim
Topic: 2421 Message: 2426

Rick,
tnx a lot for all your work! V4 is progressing in leaps and bounds!

My newbie´s answers to your questions:

1) No opinion.
2) Nice to have: a) Name and QTH: I usually enter them manually into the add/edit contact box during the qso or edit immediately after. So the contacts may be imported into my logger long after the event. b) RST sent/rcvd: appliccable? How to translate score/sn ? What is sgr rpt standard for V4?
3) Yes, please.
4) It appears so. Import to DxKeeper (my default logger): ok.
5) Dunno. See also Bernie´s response on V4.

One more comment (strictly a matter of taste): I´d be happy with plain vanilla exporting to *.adi files. KISS. I´m aware there are bridging applications between various loggers and suites, also applications that interoperate with said suites. Also applications that use key combinations to enter data from the receive frame into the log. To me, all of that would be overkill. No need to open a can of worms. My personal preference is non rubberstamp qsos which leave me plenty of time to enter data manually.

Ed:

ADIF (Amateur Data Interchange Format) is a standard for entering QSOs into a computer based logging programs.

For more information, use Google with the keywords 'ADIF Specification'

From: Rick Muething
Topic: 2421 Message: 2434

Ed,
When release in the next release V4 Chat will simple create an additional log in ADIF format. This will allow other programs, etc to capture V4 QSO information (Date, Time, Call sign, mode, frequency, name, QTH, Comment). You can ignore it our use it....its just another log in a specific format which many have asked for.

Hi Rick:

I loaded the test ADIF file into MIXW, Ham Radio Deluxe and DX Keeper with no problems. These programs were happy with the use of V4 as the mode.

At the present time, uploading to LOTW and eql.cc will require the use of a mapping function for the mode. One eqsl.cc QSL I received, used HFSK which is not really defined but appears to be in the ADIF specification.

Ideally, there should be a way to log FEC transmissions.

I am unaware of how to get V4 onto the "approved list" of ADIF modes.
Perhaps someone out there knows what needs to be done?

73, Bernie

Rick,
All looks great. Thank you. ADIF works FB here.
I would like to have FEC contacts added in the log.
How hard would it be to code that only if you have selcted FEC that it would prompt for start\end date and times?
As I said, otherwise all looks great.

I worked on this some today. It will now provide some automatic minimal logging for FEC that should provide a legal log. It also will include Name, QTH and Session AVG S/N for ARQ connections. We can tweak it some later but I would rather not have to require users to make special log entries...What I have now is completely automatic and transparent.

From: Paul Whitaker
Topic: 2421 Message: 2438

Hi all,
Have not seen good band conditions on 20 here in VK3 lately.
Having said that, its interesting to note that a number of stations
appeared on my screen overnight (I was asleep !)
KB0E 14:34, GW0EZY 15:16, GI5DS 15:46, G3NRW 17:32, G4LPW
20:11, K4PDW 20:17?,
G4LPW 20:22 (tried to connect, but was very weak), KD4QS 20:31, and
NY3J 20:53. All 14073.

V4 0.6.5.0 seems to be very sensitive, decoding even when my TX cant make
it back !.

Ill keep looking...

Thanks for the mention Paul. I was running about 50 watts to a
160/80/40m trap dipole with a somewhat inefficient ATU to tune the
antenna system to 20m. I did hear an IS???? station at around the same
time, but there was some very strong nasty, spiky QRM that made a QSO
impossible.

I hope to be on 20m again at around 1800 UTC this evening. Announcement
as usual at:

2441. V4Chat 0.6.6.0 posted to Autoupdate and on Yahoo FTP

Yahoo group: V4Protocol
Date: 2011-10-12 11:57:58 UTC
From: kn6kb
Topic: 2441 Message: 2441

All,

This new update fixes some minor problems and addes ADIF logging. Read the updated help on the logging page for a link to ADIF and available logging programs. We may do some minor tweaking on the logging but it is pretty functional now.

73,

Rick KN6KB

V4 Chat Revision History

Date: Rev Change Summary

Oct 12,2011 0.6.6.0 Release of 0.6.5.1

Oct 11,2011 0.6.5.1 Replace Autoupdate with latest version now with pop up reminder.
Add mechanism to restore focus to rtbSend after rtbSession update.
Add ARQ and FEC QSO loging to ADIF format in .adi log.
Change grdContacts columns to read only to eliminate problems with row seleciton on cell click.

V4 TNC Revision History

Date Rev # Summary ofChanges

Oct 12, 2011 0.6.6.0 Release of 0.6.5.1

Oct 11, 2011 0.6.5.1 Add function to capture Average S/N for session and send to host at end of ARQ session.

From: Fred Bourne
Topic: 2449 Message: 2449

Hi Gi's.

Well 10 is nicely open and all is working fine the Auto update worked fine this morning.

And V4 works fine with both the rigs I have FT 847 and the FT 1000mp.

I have to put the Frequency in by hand for the log entry. No hard ship.

Cat works all ok.

Cheers Rick

From: Peter Zingsheim
Topic: 2441 Message: 2450

Rnx, Rick.

Autoupdate from 0.6.5.0 to 0.6.6.0 ok.

FEC calls into dummy load: entry into ADIF log. No entry in minilog.

ARQ CQ calls into dummy load show up in ADIF log.

Dummy QSO added to minilog does not show up in ADIF log.

It appears as if successful transfer of an ARQ contact to ADIF log requires being connected to a remote stn. Confirmed by on air connect.

Old entries (pre 0.6.6.0) in minilog do not show up in ADIF log. Feature or fault? How do I get them into the ADIF log?

Peter,

It is working as designed:
1) First there is no provisions for trying to go back through the mini log and bring those QSOs into the adif log...There can be just too many missing parameters e.g. Start and stop times, S/N etc. The adif log would be sparse and mostly useless.
2) The mini log is and always has been manual. You add'/delete entries by right clicking on the log as described in the Help.
3) The adif log will automatically log each ARQ QSO with Call sign, Frequency (assuming you are using radio control), mode, start date/time (UTC) stop time UTC, Avg S/N and a comment indicating V4 ARQ. IF the call sign MATCHES one in the mini log it will pick up the name and QTH from the mini log otherwise those are left out of the ADIF log (as explained in the help).
4) The ADIF log will also log connect attempts (CQ or calls to a Call sign) and those are identified in the Comment field.
5) The ADIF log will only provide minimum logging on FEC mode. There is no “connection” so there is no knowledge of any QSO call signs in FEC. There is no specific CONNECTED or DISCONNECTED time so the log simply logs the start time of an FEC transmission. It only logs every two minutes if you are doing repeated FEC transmissions. Basically the adif log is designed for QSOs which are ARQ but it does contain some info for FEC which may satisfy legal logging criteria. (I am not and refuse to become an armchair lawyer!)

Lets get some feedback and usage on this first and then see:
1) Are there additional items which can/should be entered automatically into the ADIF log? I prefer not to REQUIRE users HAVE to enter data on each connection just to log.
2) Should the function, contents and entry/edit method for the mini log be changed. For example we could add grid columns for Stop time, Avg SN etc and then automatically enter that into the Grid...BUT then grid will become quite large and require lots of “pruning” to keep it manageable. Or perhaps doing away with the grid entirely and using an existing program or writing a simple application that can read/sort/edit the ADIF log may be more useful. I personally want to try out a couple of the adif logging programs to get a feel for how they work and what they do. The format and spec is well thought out and simple enough so I think sticking to the ADIF log is a good idea and down the road may make things like contesting, field day etc. easier with V4.

If users out there have experience and good feedback on some existing ADIF logging programs perhaps they could post some links and sources for them?

73,

Rick KN6KB

Subject: [V4Protocol] Re: V4Chat 0.6.6.0 posted to Autoupdate and on Yahoo FTP

Rnx, Rick.

Autoupdate from 0.6.5.0 to 0.6.6.0 ok.

FEC calls into dummy load: entry into ADIF log. No entry in minilog.

ARQ CQ calls into dummy load show up in ADIF log.

Dummy QSO added to minilog does not show up in ADIF log.

It appears as if successful transfer of an ARQ contact to ADIF log requires being connected to a remote stn. Confirmed by on air connect.

Old entries (pre 0.6.6.0) in minilog do not show up in ADIF log. Feature or fault? How do I get them into the ADIF log?

73, Peter

Rick, one more question:

What is necessary for name, qth to find their way into the ADIF log?
Must they be entered while connected, i.e. is post qso editing not possible?

tnx, 73, Peter

Peter,

The ADIF log record is created automatically immediately upon Disconnect on ARQ. IF there is an existing mini log entry for the call sign that entries name and QTH values are used. So during the connection you could add the call name and qth to the mini log and it would go automatically into the ADIF log. If you wait until after the connection ends then the ADIF log will be missing the name and QTH parameters.

Subject: [V4Protocol] Observed stations in VK3 last night.

Hi all,
Have not seen good band conditions on 20 here in VK3 lately.
Having said that, its interesting to note that a number of stations appeared on my screen overnight (I was asleep !)
KB0E 14:34, GW0EZY 15:16, GI5DS 15:46, G3NRW 17:32, G4LPW 20:11, K4PDW 20:17?,
G4LPW 20:22 (tried to connect, but was very weak), KD4QS 20:31, and NY3J 20:53. All 14073.

V4 0.6.5.0 seems to be very sensitive, decoding even when my TX cant make it back !.

Ill keep looking...

I have not seen this mentioned and it may be addressed in more newly released versions, but just in case it may need to be looked at, I am posting this. Normally I would not post anything about an older version, but this could be easily overlooked.

On Version 0.6.5.0 auto update started as expected, and the update was taking longer that I expected. I accidently hit the 'red x' that closes the program and I got the expected "update in progrress are you sure you want to close" message. I selected NO, but the program closed anyway. I restarted to program and repeated the steps with the same result.

Rick,

tnx for explaining your design intent so clearly. This is a great help in understanding your philosophy and reducing queries due to ignorance.

Fine with me. My vote on your idea:
"
Or perhaps doing away with the grid entirely and using an existing program or writing a simple application that can read/sort/edit the ADIF log may be more useful.
"
I would prefer to keep the grid as is. Though a dedicated application to sort/edit might be fine, I´m happy with ADIF Master as is. Hardcore contesters or DXers might have different views.

After trying many, my logger (ADIF) experience is mainly based on DxKeeper, a module of the free DXLab suite by Dave, AA6YQ. Though overwhelming at first, support via Yahoo group is second to none. Dave is extremely forthcoming and cooperative, will not rest until an issue is resolved.

www.dxlabsuite.com

73, Cheers, Peter

Rick,
now I have ADIF log automatic functionality as designed fully confirmed on air. Picks up name, qth ok, even from previous minilog entry (0.6.5.0 or earlier). Checked with ADIF Master. Excellent. Tnx.

2460. ADIF File

Yahoo group: V4Protocol
Date: 2011-10-13 15:37:51 UTC
From: w4wxa
Topic: 2460 Message: 2460

Hello Rick
I have successfully uploaded a V4 Chat
generated .adi file to eqsl.cc.

You need this for mode:
<mode:3>PAC

V4 is not accepted as of yet by eqsl's version of adif.

2461. First QSO with V4 mode

Yahoo group: V4Protocol
Date: 2011-10-13 17:32:21 UTC
From: ON2AD
Topic: 2461 Message: 2461

Hello to all,

Just finish my first QSO (Chat) with V31AE (Belize) on 10 meter.
His report I given was 559 and very loud and he used 50 Watt and a 8 el log periodic (13-30 Mhz)

My report given by V31AE was 519 and I use a IC-703 with 10 Watt on a GPA30 5 meters above the ground (see Pic on QRZ.com) and I have tuned the antenna.
Nice mode, that I must say I was a little nervous hi...

V31AE is now calling on 10 Meters.

73 de Pat ON2AD

PS: sorry for my bad English and type errors

Thanks Tom,

I have a request in to the ADIF group to get a V4 mode designation. If it doesn’t come in by the next release I’ll change the mode to PAC. They have included WINMOR which I also authored and that has been only out about 2 years.

2463. Yaesu FT450 frequency change

Yahoo group: V4Protocol
Date: 2011-10-14 01:13:17 UTC
From: kc2nyu
Topic: 2463 Message: 2463

Rick- do you see the ability to adjust the FT-450 frequency by clicking in the waterfall window anytime in the future? Or is that way down the priority list.

Tnx Paul

2464. Re: [V4Protocol] Yaesu FT450 frequency change

Yahoo group: V4Protocol
Date: 2011-10-14 10:33:41 UTC
From: Rick Muething
Topic: 2463 Message: 2464

Paul,

The FT450 is in the list and should work for setting the frequency via the mini log or Click to tune. I don't have a radio here to verify this but the code I am using has been verified on other programs (RMS Express).

There is a problem with most Yaesu models wrt readback of the frequency. This is new code and I will need time with some Yaesu radios to debug this. The debug code in the current version shows the read back Frequency command going to the radio but the Radio reply is not valid frequency data. Unfortunately Yaesu uses several different formats and codes for different models which makes this harder.

Perhaps there are other users on the reflector with a FT450 that can comment?

No problems with JUMA TRX2A/Experimental SW. Mini log and ADIF is fine. We will test V4 here in on on 80m under multipath/NVIS/aurora jitter effect. BR/73 "Yussi" OH7TE

2466. Mini Log to ADI

Yahoo group: V4Protocol
Date: 2011-10-15 17:17:56 UTC
From: w4wxa
Topic: 2466 Message: 2466

Hello all
I have written a small program to convert the data in your mini
log file in to an adif file. It is called mini2adi.exe
Down load from the link below and save it in your VChat data
folder where your mini log file is.
A file called v4chat.adi will be produced.
You can upload it to eqsl.cc
It puts a standard 599 in for a report
and a standard thanks for the qso kind of comment
You can edit those on eqsl after uploading if you like.
No guarantees with this
It might not work for you
73 de Tom, W4WXA

www.qsl.net/w4wxa/mini2adi.exe

My pleasure. But be sure to download the latest version (1.2). This
version expands on some of the detail, and fixes an error.

I got the v1.2 version. It clarified things a great deal, thanks again. The TS-590 is now on the top of my list of rigs to get. If someone feels I should look at other radios in this range (say < $2000) please feel free to send me an email if it's not apropos for this list. One of the things I like about the TS-590 with the built in USB interface is the integration of both audio and control signals over a single cable. Because of the virtual audio devices and COM port the resulting interface isn't propriatary either. I have a Kenwood TH-D72a HT.

2474. Problem with Entry Text Box

Yahoo group: V4Protocol
Date: 2011-10-17 16:17:11 UTC
From: Ned Daves
Topic: 2474 Message: 2474

Rick,
First, thank you for all of your hard work.

Another ham and I were having trouble getting ARQ communications to work. We had good propagation as we could converse in FEC mode with 100% correct copy. In ARQ mode, a connection would be made, then I was attempting to use the file paste to enter some predefined text into the text box. It would show greyed out like it had been sent to the outbound queue. But it never showed up in the OB queue character count, nor was it sent. In addition, after entering this state, even typed text would never enter the OB queue. What I discovered was that there was a CR at the end of the text file that I had entered. What seems to happen is, the text box sees the CR from the text file and greys out the text. But because the CR had not been entered from the keyboard, it does not get sent to the OB queue. And after that, even entering a CR from the keyboard does not clear the problem. Removing the CR at the end of the text file solved the problem. The text stays blue and a CR from the keyboard moves the text to the OB queue.

I hope this description is complete enough for you to find the problem. Thanks for listening.

Hi Rick,
Sure, I can do that. I also took the last CR off the end of the file. But the reason I have reported this is so that you are aware that there is a problem in your program that can cause undue frustration for users. Especially when it is not at first apparent what is causing the communications failure.

I also have been a computer programmer since 1978. Even doing significant assembly language programming. I was just trying to help you solve a problem that may have affected others that have reported text not going to the OB buffer.

After some qsos observing typical operator errors, I am pretty sure that the DEFAULT should be changed from CTRL CR to CR, but keeping all three options.

This would eliminate a lot of frustrated operators who don't even read the "#$$ manual after all else fails.

The options, especially the ctrl cr is very handy if you want to edit the stuff after entering just a CR.
And it is perfectly ok using this OPTION, after DELIBERATELY having chosen it, since then it dramatically increases the statistical probability that the operator now KNOWS what to do.

Finn,

It’s a trivial change...one line of code and I’ll probably change it. But I have a BASIC problem with trying to second guess how users set up the ONE and ONLY basic setup menu because they won’t read the help. What’s next? Guess their call sign and grid square? Assume a specific sound card? How about assuming they must be using an Icom 7200 radio on Com1? When you buy a radio they don’t have all the knobs in the default position!

An alternate approach would be to not to default ANYTHING and then force them to read the help because the form would not close until everything had been selected!

I guess it comes down to answering the question: Are you a libertarian or a socialist?

Rick...The best answer to date!! Ha Ha. HIHI, you got me.....and MAYBE quite an unverified number of others as well. I must be both. Riding two horses, running WINMOR and V4Chat at the same time.

This seems working well. Just leave V4 in FEC mode while running WINMOR, and don't leave WINMOR in Peer to Peer mode while running V4

All,
Understanding the “Send” or “move to outbound queue” function is fundamental to being able to use the program.
Actually the more I think about it the easiest way and best to encourage the user may be this:
1) If there is no call sign (as in the initial startup) the Set up menu will pop up.
2) Instead of defaulting one of the three options to the “Send” function I’ll default to none checked.
3) Upon an attempt to “Update” I’ll pop up a MSG box if none of the “Send” options has been selected advising they select one and/or read the help (requires clicking the Setup Help button which displays the full details and explanation of the setup screen).

This may at least get them to read one of the more important pages of the help since they won’t be able to operate at all without saving the setup (which has the call sign).

Maybe this is going to far? I seem to recall some axiom about “when you finally make something idiot proof only idiots will use it!”
Comments?

I try second time. First was a joke. Did not pop up. This one is serious. Maybe Ricks suggestion really IS good. Forcing the users make a deliberate choice after reading something of the Help info.

This issue really IS crucial making the V4CHAT SW WORK.

Date: 2011-10-24 13:34:12 UTC
From: rapidan2011
Topic: 2484 Message: 2484

In the past several days I have not heard one V4 station on any of the recommended frequencies. The last V4 contact I had was with a guy in England on 20 mtrs.

With the bands as hot as they are I am surprised.

Hi Yussi..
I haven't worked you on 28073.0 Khz yet...
the 73 qrg is good for calling, you can always qsy after...
Today, propagation wasn't as good as b4... I had aurora on 6 meters...Flatter flatter audio hihi...With 6y...

If you are idle, and not turning the vfo, stay at 28o73.0 khz for v4chat calls..I might call cq, what I did b4 but nada yet...We are only a few v4chat guys. I do 7Mhz dx at nights, ssb...Working Europe...

73 from a hot spot...

Okay Robert!

I will be 28073 on 10m in future, when band is open.
We use here in "OH" 40 m QRG 7045 USB for digital mode testing.
Most WM/RFSM and ALE400 ARQ but we listen carefully if any V4 is visible or
hrd...hi.
Best activty time is weekends abt 09 ... 14 UTC.

Now I will go V4 and QRV/calling 7045 abt 45 minutes, then QZZ...zzzz

73 "yussi" OH7TE

Hi Robert,

I see Hurricane Rina heading your way on the http://www.hwn.org/stormpulse_atlantic.html site.
The site says it is packing 85MPH winds.
Looks like its going to pass over Cozumel.

Good luck,
Fred, W1WYC

2499. V4Chat update 0.6.7.0 posted on Yahoo FTP and auto update server

Yahoo group: V4Protocol
Date: 2011-10-28 00:36:00 UTC
From: kn6kb
Topic: 2499 Message: 2499

All,
Some of you reported problems and while I am not sure this update will fix all it definitely will help with cases that were seeing very high traffic on the TCP Command port due to BUFFER messages. This fix only sends the messages (sent from the TNC to display the OB buffer size on V4Chat) only on buffer changes.

Also the default value (this won't affect any existing users) for the "Send Command" is now none selected forcing the user to make a selection and advising him of the help file information.

Help is also updated.

I am working on the Yaesu readback problems but will be taking a few days off so not sure I will get them done this week. I wanted this update to get out however as it aparently causes problems on some computers.

As usual if you have a problem. Note the UTC time. Describe the problem in as much detail as you can. Send the V4TNC Debug log and any exception logs to me as attachments at rmuethingATcfl.rr.com

73,

Rick KN6KB

2500. Where to start?

Hi all,
Well i have the software installed and it seems to be operating ok, but where is everybody?

I've tried calling CQ on some frequencies people have said they are listening to in earlier threads on the off chance but no joy to date.

I am in VK3, what frequencies are people typically monitoring for V4.

Cheers
Matt

Try around 7.073 then 14.073. You can also schedule a QSO here with somebody.

>Hi Matt,

Ill have my system running on 14073 USB over the weekend.
If im not in the shack, you can connect ARQ to my callsign for a test.
I only have 80, 40 & 20 mtr antennas, so usually leave the syste, on 14073.
Amazing what comes up overnight....

Cheers

Hi Matt,
Been out all avo, just got your EMail.
Had a look - Yes, your callsign, and something about still learning to
drive this... very broken, and no actual CQ's decoded, so no time stamp.
Im home now, and will be for a while - wish it had a BELL function to close
a relay on the interface to operate an alarm is callsign detected....

Talk soon. - You could always sent me a quick text to get my
attention. 0414314025

2509. Flex Radio Causes Lock Up of Connected Station's V4

Yahoo group: V4Protocol
Date: 2011-11-01 13:13:40 UTC
From: rapidan2011
Topic: 2509 Message: 2509

I ran into an interesting problem where the station I was connected to locked up when I became the ISS. Upon retries it happened again and again. Having data in the buffer or not made no difference.

I am running the FLEX 3000 SDR with the latest software v.2.2.3.

When I switch to either an ICOM 706 or 746, all is sweet.

Ted, WB2LOU

Due to a sad occurrence I've had to rebuild my WinXP system. When I went to install V4Chat again it said I need .NET 3.5. I followed the link to get that and what it leads to is .NET 4 Which I installed but V4Chat doesn't seem to buy.

Well then I saw the C:\V4Chat directory is still there, so I went into it and clicked on the setup icon. And it opened a window saying it was installing .NET 3.5 Framework SP1 but the progress bar never moved. Another window opened saying Please wait while setup configures the components, but also a progress bar that never moves.

Well after I went away for a while and came back it had installed
V4Chat, and the ControlPanel->Add or Remove Programs shows that
.NET 3.5 is there. (Along with .NET 4)

So the only real problem is that the installer seems to lead you to
the wrong place at Microsoft if it thinks you need to install .NET 3.5

John, The 80-mtr frequency in the US would be 3573 kHz (not 3073). The US amateur 80-mtr band starts at 3500 kHz for Extra class licensees. The General and Advanced class allocation is from 3525 to 3600 kHz.

3073 is probably a military frequency with some MARS (Military Auxiliary Radio System) activity.

3573 kHz would be a good freq for VK-land also. I think you had a typo in your message, and you actually meant 3573 kHz.

Good luck with V4Chat. It is a fun mode.

2519. ARQ & FEC

Yahoo group: V4Protocol
Date: 2011-11-03 23:11:55 UTC
From: Paul Whitaker
Topic: 2519 Message: 2519

Hi all,
I am observing an interesting situation - I leave my system running on
14073 overnight ARQ, and it usually shows a number of CQ's or actual connects.
The CQ's are ALWAYS well formed - no errors etc.
But when a connect between two other stations happens, there is usually a
LOT of crossed out red text, with some decoded correctly.
I would think that the CQ is a FEC mode - and when connected, it is ARQ
'Chat' with error correction. My station is not synchronized
in that case, so I thought it would only be as good as FEC - but FEC is far
better.
Further, I have tried on a number of occasions to conduct a FEC 'Net', but
very poor results. (usually on noisy 80 mtr)

Just observing. I would have thought the monitoring would have been as good
as the FEC CQ call !

Anyone notice this ?

Paul Whitaker.

my 'off the cuff' opinion is that in FEC you get good packets , bad packets, and half-whatever packets....
that's why you get the 'red stuff'. AND when you're monitoring someone else, you are, in effect, using/viewing FEC because you are not a 'connected' part of the conversation.

BUT when you are one of the 2 (no more, no less) connected stations in ARQ, mode there is no such thing as a bad packet -- your partner will keep resending the offending packet until you acknowledge it as being 'perfect' - and you will do the same for him..

that wonderful feature of ARQ is why someone monitoring might see duplicate sentence fragments.

Hi Jack,
Yes, I understand that.
Its just that I would expect to see repeats, as you mention, but apart from the CQ call or Connect, its mostly red.
And yes, I agree about mistakes without the ability to ask for repeat - but it would seem that there is something more
stable about the FEC CQ or Connect, to my system, compared to the ARQ Chat, or even the FEC Nets we have tried to run.

Just an observation - donent make sense !

The Auto update is working perfectly, and we have had quite a few ARQ chats with great success.
Thanks for the work Rick - My Hat off to you and others that can work magic with the keyboard !

From: John Hirth
Topic: 2519 Message: 2525

I've noticed marginal copy at times too, when monitoring other ARQ QSOs.

One thing I've noticed is that V4Chat often starts to decode the frames that are ACKs or NAKs (the short frames) but doesn't seem to get back into the "ready" mode in time to catch the leader of the other station's data frame. So some of the data frames are lost, even if the station sounds "good". Now my computer is just a rather old 1.4GHz Pentium M with 2GB or memory, so I'm sure that it's now slower than most and probably explains what I'm seeing.

I'm not sure if this goes to the heart of your comment, but I just thought I'd drop it in as food for thought.

John,

There is a mechanism that has been in V4Chat and V4 TNC since the beginning called the debug log. If you enable it very accurate time tags (to 10 ms) are logged at key points in the V4 TNC program. This all was and is there to aid in debugging and optimization and has been invaluable in tracking down real problems and also in finding “setup” or “cockpit” problems in the protocol.

I seriously doubt there is any timing problem with a 1.4 GHz computer and 2 G of memory...V4 is successfully running on much slower machines than that and there is considerable decoding margin built into the timing. But in any case the REAL mechanism for locating if it is a problem and where it might be always comes down to the following:
1) Enable the debug log
2) Describe as best as possible the problem observed and the exact time (UTC as close as possible) it was observed.
3) Include the log as an attachment to and send to me...in some cases both ends of the session may be required which is a bit more difficult but possible.

This is practically the ONLY way improvement can be made and has resulted in continual and dramatic improvements in the V4 Protocol and V4 Chat over the past 11 months or so. Debugging or optimizing the performance of a protocol is not some thing than can be done by guess work or casual observations.

Hi Rick,

Thanks for the reminder of how to send you information of use to you in debugging a "situation". I've used it to send several sets of logs to you as I've encountered past problems. Monitoring established ARQ QSOs, while interesting and I do use it, is not of high value in my type of operating. I've never thought this was anywhere near enough of an issue to warrant reporting, as V4Chat works very well for me in ARQ QSOs.

Thanks again for all your work!

2529. Release of V4Chat and V4 TNC 1.0.0.0

Yahoo group: V4Protocol
Date: 2011-11-12 19:25:12 UTC
From: kn6kb
Topic: 2529 Message: 2529

All,

I have uploaded to the Yahoo FTP server and to the auto update server the latest release of V4Chat and the V4 TNC. These are basically minor updates but do improve the reliability with improved timing margins.

Special thanks to WB2LOU and K1DOW for their testing of these updates and providing important feedback.

This basically ends the year long Beta test effort although certainly bugs will still be found and upgrades generated. Thanks to all those that contributed to the V4 beta test effort over the last 12 months.

I am still working on some issues with readback of the frequency data on Yaesu radios.

I am looking into some additional logging mechanisms to log range and bearing information or gridsquare. What this might lead to is a near future contest weekend where we try and see how many V4 stations can be worked. Those that might have any ideas about this or suggestions please contact me.

Mushtaq,

I am not sure what an “auto CQ” is. There is already a CQ calling mechanism built in and used for ARQ. (Click ARQ Call, CQ) This sends a specailly formatted frame that ID’s the sender and tells everyone he is calling CQ. Stations can then answer him in ARQ by (Click ARQ Call, Entering the target call sign and then Clicking Call Callsign). All this explained in the help file.

The ARQ connection is initiated by very specificly formatted frame containing the Sender’s and target call sign.

For FEC operation the easiest thing is to edit up a formatted file saying what you wish and saving it as a users file. It could be a general CQ, DX CQ, contest CQ or whatever you wish. Read in the help about how to generate and use User files.

Rick,

I think he is talking about putting in a countdown timer. Configure the timer, hit the CQ button, and let it do its thing. If you make the timer for 30 seconds, 30 seconds after the last CQ, V4 calls CQ again.

FLDigi has a macro that will allow you to do it. My problem is I forget I did it and walk out of the shack. :)

Thanks Joel,
That makes some sense but I am always reluctant to put any automatic/unattended mechanism into what is supposed to be a “keyboard” program. There have already been requests for things like the ability to “leave messages” etc. but there are already good programs and protocols around that will handle unattended ARQ operation and messages (e.g. RMS Express with WINMOR, BPQ32 etc.). It is too easy to create automatic QRM generators! If someone can explain the value in such an Auto CQ and a reliable method for protecting against unattended QRM I will of course consider putting it in.

Rick,

I think he is talking about putting in a countdown timer. Configure the timer, hit the CQ button, and let it do its thing. If you make the timer for 30 seconds, 30 seconds after the last CQ, V4 calls CQ again.

FLDigi has a macro that will allow you to do it. My problem is I forget I did it and walk out of the shack. :)

Mushtaq,

I am not sure what an “auto CQ” is. There is already a CQ calling mechanism built in and used for ARQ. (Click ARQ Call, CQ) This sends a specailly formatted frame that ID’s the sender and tells everyone he is calling CQ. Stations can then answer him in ARQ by (Click ARQ Call, Entering the target call sign and then Clicking Call Callsign). All this explained in the help file.

The ARQ connection is initiated by very specificly formatted frame containing the Sender’s and target call sign.

For FEC operation the easiest thing is to edit up a formatted file saying what you wish and saving it as a users file. It could be a general CQ, DX CQ, contest CQ or whatever you wish. Read in the help about how to generate and use User files.

Hi Rick,

MixW has an auto CQ also. You can use the default text as below or create your own.
You can also set the delay between CQ's or use the default of 10 seconds.

Personally I don't use it but nice feature. I'd be with Joel, W4JBB. Good thing I shut the rig down at nite. Hi Hi.

Rick from Rick,

And another thing ... MixW has, when a station responds to the CQ the CQing station stops calling and alarms. I suggested that for DM780 but it never got implemented. Would be nice for all the multi mode programs.

This makes no sense. There is no proven benefit. What good will it do.

Adding these little quirky Apps only builds more overhead and could possibly inhibit V4 performance.

We have enough QRM generators in the human form, why more?

Finn,

You can already do a repeat with two clicks now (ARQ Call, CQ) or (ARQ Call, Call Callsign). Why add another seldom used button to crowd and confuse and save one click? That is just not good GUI design.

Bernie,

Bug fixing priority is based on a number of things:
1) How serious is it?
2) How many users does it effect? (there aren't too many 735 users now days)
3) Do I have the resources to easily fix it...e.g. I don't have access to a 735 myself so fixes to that end up being totally trial and error often requiring many iterations of me making a change, trying to capture more info on the effect of the change, and having some one else run the test.
4) How much time I have to devote to the project and the type of bug fix. Right now I am pretty busy with several projects. Remember this is all volunteer work often 20 + hours a week or more.

I have the 735 bug and the readback from Yaesu radios on my list as well as a few others but I needed to get this release out since it affected almost every user since it had to do with some marginal timing situations. The net result is more reliable operation for most users.

Kirk,

You probably don’t have a default email client installed or selected on the computer.

You can clear it with this:
1) Shut down V4Chat
2) Find the V4 TNC.ini file (not the V4Chat.ini file) it is in the V4Chat directory.
3) Open the file with any text editor program. Note pad, word pad etc.
4) If there is a line in the file that reads:
“Registration Email Sent=False”
change it to
“Registration Email Sent=True”
5) If there is no line referencing the above simply add the line:
“Registration Email Sent=True” (no quotes of course)
6) Save the ini file back.
7) If you have registered the program and have a registration key make sure you make a back up copy or write the key down. It is a time consuming process to recover it if you loose it.

Subject: [V4Protocol] How to clear a popup message.

I had to rebuild a computer and once I loaded V4 and re-placed my user information, everything worked great. The only thing is that each time I execute V4 I get this popup message that says. "An email will be cent to Register your call Registration in the V4 Registration data base." How do I get rid of this popup?

Thanks,

Kirk, K6KAR

Rick, you are probably right. I also did not think of it before. The thougth just stumbled into my mind because of the AutoQrm discussion.
Not a "not good" GUI, more a "no GUI at all" solution.... more command based trick "in beween".

A joke. Please forget it. There are more important tasks ahead :-)

Bernie,
The Article is a good idea. I would be willing to help and co author with someone else. The earlier papers I wrote on V4 for DCC were pretty technical...what is probably needed now is a more “hands on” how do I set it up and use it type of article.

Another promotional Idea I had was some type of contest. In a near future release I plan to include a simple mechanism for automatically exchanging grid squares on a V4 ARQ QSO. We could use that and V4Chat’s standard ADIF log to make it easy to submit and “score” a V4 contest. It would emphasize the accuracy of the V4 ARQ and the efficiency of exchanging and logging basic QSO data. Those that are more familiar with contesting could help set this up.

Bernie and Rick. In an article it also could be focused on the ability to direct inform another field Winlink station about that NOW a message (maybe urgent) is sent into the wl2ksystem (using pactor, winmor or whatever on whatever band.)

This works if one known usable non winlink frequency could be agreed upon as stby for everybody participation in an action. For voice and V4Chat.

If it works voice or V4, good. If not, you just need to wait for the target station to check into Winlink system by his normal routine.

I have so far not seen any problem being online RMS Express and V4Chat at the same time, even WINMOR session ready though NOT P2P.

I use manual tune of the radio.

Such information given by V4CHAT may have a better chance of getting through if qrm than pure voice which could be the primary administrative communication.

Have I have missed something here?

From: Peter Zingsheim
Topic: 2529 Message: 2556

Hi,
my 2 cents:
To me, a keyboard program means just that: keys used for typing. "chat" is the keyword. Right now, V4Chat sets itself apart from the crowd. There are plenty of other digimodes with apps that use keys for shortcuts to all sorts of canned texts and rubber stamps. Any feature, if provided, will eventually be used by the crowd. Following the crowd is not my concept of progress.

From: Robert Belize
Topic: 2558 Message: 2558

All.....

looking forward to that event....

logbook:
Freq, call sign, time is auto logged. Thanks Rick!

The Name of the qso partner should/could be highlighted in the text window and made clickable, to be included into the log.
Right now you have to cut and paste..
Clearing the text windows could be one click only! its easier..Right now it's asking "are you sure"

Any comment?

Robert,

I am not sure how much you save by highlighting the name:
1) You have to highlight the name ...the program can't determine the name from the text.
2) You have to right click on the highlighted name ...right now you can copy that for pasting.
3) If I provided another right click option to "paste name to mini log" it could save 1 mouse click as long as the target location of the paste was assumed.

Re: confirmation of clear. It can't be undone...I do not like unconfirmed clearing of things that can't be undone. And add to that it is not necessary to ever clear the windows...I use it very infrequently here. There have been no other requests to streamline the clear.

These things fall into what I call the category of personal GUI nits. No two people will agree. If I get lots of requests to change something like this it may be good to do so....but if I for example act on a single request it is likely I will get 5 more that say either "put it back the way it was" or "make it a user selected option" ...the later gets very complicated very quickly. User character sets, user fonts, user colors, user commands etc.

My main focus to date has been to make the V4 Protocol solid and useable and fairly simple to setup. V4Chat is just one of many possible clients or GUI that could use the V4 TNC and in time I suspect there will be others wishing to develop their own client/servers and GUI using the V4 TNC.

I first heard about V4 last night while in QSO with a station. He told me that it was "available for many computers", so I found and joined the group to find out more.

However, from what I see looking at the files section, it's only available for Windows. Is that correct?

I'm running a Macintosh.

Ken,

The V4 TNC and V4 Chat are written for Windows. I have heard however of successful operation on recent Mac's using Parallel http://www.parallels.com/products/desktop/ This is a fairly recent and efficient program that has been reported to work well on recent Macs on this forum. I think it is fairly reasonable at about $79.

Perhaps some V4 Mac users can comment.

I first heard about V4 last night while in QSO with a station. He told me that it was "available for many computers", so I found and joined the group to find out more.

However, from what I see looking at the files section, it's only available for Windows. Is that correct?

I'm running a Macintosh.

Robert,
Trying to interpret sent text is probably a very slippery slope!...
In the next release however I am going to include a simple automatic send/receive/capture of the Grid squares for each side. These will automatically go into the ADIF log file. This is something that is simple, standardized (e.g. EL98 or EL98pf) and independent of language.

<<< ...the program canâ☐☐t determine the name from the text.**>>>**

Hmmmm.... just a thought... usually the sender says "my name is"
After that sentence the following word is his/her "name"... software could read that and highlight that word to be included into the log...
I could be wrong...

Thank you for your work Rick...

From: Rick Muething
Topic: 2560 Message: 2569

I have had a number of requests about if/how to run V4Chat and the V4 TNC on a Mac.
I am aware of at least one successful installation using Parallels
http://www.parallels.com/products/desktop/ .
This works for late model Mac's using Intel's Core 2 Duo, Core i3, Core i5, Core i7, or Xeon processors.
If anyone out there has had success with this or other emulator type programs please post your experience. I will combine into an expanded document and post to the reflector.
Thanks,
Rick KN6KB

If you install Parallels, I believe you also have to install a copy of the Microsoft operating system ($$$), and learning to live with it, plus start worrying about virus protection, etc.

Personally, I am not interested in going that route, it's more trouble than it's worth....

I went to a Mac because I wanted to avoid all the Microsoft hassles.

Understood Ken...but there just doesn't seem to be any hams willing or capable of translating the V4Chat and V4 TNC .NET code to the Mac so Parallels is an option to having nothing. Programmers (and unfortunately virus writers too) usually write code for Windows first because it has such a large share of the market...basic economics.

I can't justify the expense of a Mac, Mac Development tools, and the time required for a program (V4Chat/V4 TNC) that is free. It would sure help if Apple supplied productive, low cost OS, development tools, and programs for 501C3 groups like Microsoft does.

Rick,

Thanks for the comments. I'm not complaining, just documenting my viewpoint.

Maybe someday if I upgrade the rig to something with CAT control I'll be forced to buy a Windows machine. Yes, Apple is a bit insular in their outlook. But things have been worse: when the Mac was first introduced, developers had to buy a Lisa machine ($10K) to do any Mac development!

From: Jerry Curry
Topic: 2560 Message: 2574

Ken,

I run Parallels on my i7 iMac and on my i5 Mac PowerBook. I have XP installed on both machines. V4 runs just fine on both. Also run Airmail and RMS Express. Even my RMS software runs OK. I've run the RMS on it for a few hours when I had to change a power supply in the HP machine that the RMS normally runs on. I also run MixW2, WinPSKe, and a few other windows based programs on the XP side. Good thing is many of those don't need access to the internet to function. I don't run any anti-virus software on either OS but I'm careful not to access the internet with the XP side running.

As for dealing with the quirks of Microsoft…. I've had to stumble around a bit but feel somewhat comfortable…by no means an expert.

Take another look at it before you throw in the towel. It's a good opportunity to have your cake and eat it too!

2576. Speed of performance during FEC

Yahoo group: V4Protocol
Date: 2011-11-17 01:17:49 UTC
From: la7um
Topic: 2576 Message: 2576

Rick. I got the idea from your posting on another reflector. Reliable decoding versus speed.
Combining this with the old Pactor fec: 2 repeats (default, as in amtor fec) to 5 repeats, speed versus robustnes).

Could such a choice, maybe to even more than 5, when tx in fec mode be implemented in V4?

This probably needs some automatic corresponding adjustments on the RX side for correct interpretation as well.

Sometimes some short net "broadcasts" could justify and benefit from maximizing correct reception at the cost of speed within reasonable limits.

Just an idea.

Finn,

The problem is all in the details...like life!

If you use a repeating FEC mechanism 2,3, 4, etc Then you have to do two things...one is easy the other not so easy.
1) You have to repeat the frame a fixed number of times and make it so if the receiver gets a duplicate it suppresses the duplicate. This is easy ...the Monitoring capability of the ARQ mode already has this in it.

2) The hard part .... what if the receiver doesn't get a correct decode at all? Do you show everything received (including repeats)? Do you not show anything? How do you make it "readable" at the received end?

Then there is the small matter of speed. The Max FEC rate is about 45 WPM now. Doing three repeats drops this to 15 WPM pretty slow. It is also not very efficient. (You get a better chance of receiving not by repeating but by changing the FEC mode (e.g. adding more redundancy) such as Reed Solomon on top of the Viterbi.

In the end it comes down to engineering. If what you want is the most reliable 15 WPM FEC mechanism you can get ...then state that as a goal and design to it. Right now I don't have the time for this or getting heavy into FEC modes of the current V4.

Almost every decision in engineering is not based on "Can It be done?" it is based on "Is this the best return on a limited resource?"

If this is seriously considered it should be an option of the operator. Under general conditions V4 has excellent data flow and even with weak signal conditions V4 AEQ does a good job. QRM can have a negative impact that is not corrected with FEC either.

Also if it auto switches to FEC...is there an auto disconnect ? What does the other operator do ??

My thought overall is Pactor and Amator are what they are...Pactor and Amator. V4 is a simple reliable inexpensive product to provide a AEQ chat mode, let's keep it simple.

Date: 2011-11-17 17:51:50 UTC
From: Siegfried Jackstien
Topic: 2576 Message: 2579

And if you repeat the frame several times there is a good chance to get it
correct if you have a start sequence where receiver can lock on (sync) and
collect the data together
If in first repeat there is an error in a part that is not disturbed in the
second repeat and/or third then you have the frame correct
(that would be spreading the data but in time domain)
And these three or five packet (as example) can be made further robust with
control numbers and additional coding ...
That all would improve robustness ... but would cost trough-put (as rick
already described) so ... the thing is needed speed, needed bandwidth,
needed snr value ... and not forget mr Shannon :-)

From: la7um
Topic: 2576 Message: 2580

Rick. Yes I see the detail issue. And I love that you by yourself is introducing even the redundancy issue adding Reed Solomon, hi.

So when adding a user selectable extra 3. fec and/or also ditto Reed Solomon, the V4Chat is probably getting a high (highest?) rank on all FSK-getting through mud and Aurora tests there is.

Your #2..a suggestion
If 2 of 3 characters is the same, print the winner character in red with a line through. Thus enabling an alertnes on the RX side.

If all three is different, print f.ex a ? with another colour and another bold or italic style and also with a line through. Thus alerting even stronger, helping the RX station also now.

There was some choosable "missed character" option in Amtor I believe, but don't remember if that was in FEC or ARQ mode.

As to the matter of speed. Yes. Teds suggestion of making an ON OFF operator choice on the TX side is off course a smart solution, kind of similar to the old P1 FEC option.

As you said: In the END it comes down to engineering.

But:
1: there need to be an idea, maybe wild.

2: there need being a kind of quasi economic analysis....cost/benefit
Like the case of refining free "good enough....(what is good enough?) SW" postponing other important free SW.

Since free, the marked price adjustment mechanism does not work, then it is the queue as sorting mechanism, + off course what the programmer himself find to be fun and challenging.

Probably at the time being a best solution is just sleeping on the idea while doing the other more urgent tasks.

As far as I remember from some economic theory, unless a war going on, MAXIMATION of production is NEVER the best solution. An Optimalisation usually is the way to go, calculating in the costs.

Like you say:
â☐☐Is this the best return on a limited resource?â☐☐

3: IF the sleeping and "cost benefit analysis" using the inherent engineering skills as a rough guidance ends up with a GO,

then:
4: In the END it comes down to heavy engineering.

By the way....is it a "good return on a limited resource?" introducing a "Bell". CtrlG or something making a sound alertness?
If not that is messing up with the soundcard settings?

I know, I know,,,I hit myself regarding a new DSP Soundcard Packet protocoll.....

Ted. The idea was seriously meant from me. But when or if implemented needs balancing against other tasks. I agreee whith your suggestion of being an operator option.

When conds are good, it is a waste. But when in the middle of Aurora it may come in handy.

Like the old P1 option it was meant to be a choice for TX FEC non arq pactor 1 station and the RX station did not need doing anything as far as I remember.

2582. V4Chat vs. PSK

Yahoo group: V4Protocol
Date: 2011-11-20 14:51:08 UTC
From: Fred G -w1wyc
Topic: 2582 Message: 2582

Looks like the twenty meter band is consumed with a PSK contest.
Not a chance for V4Chat but I'll monitor 14073.000 dial anyway.
I may not be in earshot of the rig but try a connect anyway.

Fred, W1WYC

From: Fred G -w1wyc
Topic: 2582 Message: 2583

Hi again folks,

Sorry I wasn't at the keyboard but here in New England the leaves are falling.
I had to do some clean up. We have rain/snow coming.
I did check the rig a while ago and saw two connects:
GI4LKG, Victor in Belfast
and
K4KAH, Garry in Georgia.

With foul wx coming I'll be spending more time on the rig. Hopefully catch up with you soon.
Sounds like propagation is improving.

73 and thanks,
Fred, W1WYC, FN42jm

2585. V4Chat 1.0.1.0 uploaded to Yahoo FTP and auto update server

Yahoo group: V4Protocol
Date: 2011-11-29 20:39:40 UTC
From: kn6kb
Topic: 2585 Message: 2585

All,
Hope you all had a good Thanksgiving holiday...I enjoyed some time off and a visit with my sister.

I have uploaded an update to version 1.0.1.0. This should auto update for those with auto update enabled. The full install is posted on the Yahoo FTP as well. Generally minor but useful changes:

1) Now a "word mode" send command is available allowing a "send command" on each space. See the help and the new Setup menu. Several have asked for this and I do find it "comfortable" to send with.

2) Option to automatically send and log your qrid square on a connect. Also in the new setup menu. Checking AutosendGS will send your grid square upon an ARQ connection. This is also automatically logged into a "GRIDSQUARE" column of the ADIF log. This could be useful for contests etc. Again the updated help will explain.

Known remaining problems:
1) Problem with frequency read back on:
Early Icom's (specifically 735 and 765) basic problem is they don't seem to be adhering to the Icom CI-V commands as documented.

Yaesu Radios. I haven't been able to test this correctly yet. In process.

If you have serious problems please let me know. Be sure to enable debug logging.

I would be interested in setting up a V4 contest in the future. The auto GS logging in this new version could be used to compute points based on grid square, distance, etc.

73,

Rick KN6KB

Carl,
You need to be a bit more specific:
e.g.

Are you talking about playing the sound card? keying the radio? controlling the radio freq? or read back of the radio freq?
What is your setup (sound card/interface, control and keying mechanism etc.)
Are you trying to use the built in sound card...NOT recommended from almost all with any experience!
Turn on the Debug log if not already on and try and duplicate the problem. Then send the log as an attachment with observed details and time (UTC) directly to me if possible.

Hello Rick,

Carl lives down the street from me and I did the initial install on his station - he is new to digital modes. He has a late model computers and HRD runs fine in all aspects but both V4 Chat and RMS Express exhibit the same symptoms - no keying of the K3 radio and no rig control with either case. Both programs installed easily with no errors.

I have looked in Device Manager to see what ports to use and we are using the USB codec for his Signalink interface. So, I'm a little stumped here. His screens are virtual copies of what I am running on my station.

Hopefully, you can help us.

Rick,
There are several ways to key the radio:
1)With a SignaLink USB use the SingnaLink releay output to drive the radio PTT
2) Use a separate dedicated RS232 port via signal DTR or RTS. (may require level shifter to key the PTT line of course)
3) Use Radio control keying (e.g. Via CAT control) via serial port. Not useable on all radios.. I don't recall off hand what the K3 uses or even if it supports CAT keying. I suspect it might use the same as the Kenwoods. One has to look into the control codes for the K3 or else try different combinations. Of course the baud rate of the control port must match the radio.
4) True VOX on the radio (requires setting up for VOX operation and minimizing VOX delay)

The help describes all 4 methods...one of which will always work. I generally prefer the SignaLink relay output to the Transceiver PTT.

Maybe someone with a K3 can comment or let us know settings that work?

From: Rick Muething
Topic: 2590 Message: 2591

All,

Glad to see my request for inclusion of “V4” as a recognized ADIF mode was accepted.

The next V4Chat release will include a slight modification of the ADIF header indicating it is 3.00 compliant and include information on the program and version generating it along with the STATION_CALLSIGN field as suggested in ADIF 3.0.0.

I have not yet heard any reports or problems on the automatic (if Autosend GS is checked in the Setup menu) sending and logging of the local grid square in Version 1.0.1.0. When checked this should generate an automatic entry into the ADIF log of the GRIDSQUARE parameter at the receiving end. The intent is this will make it easy to process the ADIF log for contests etc.

2592. Linux Port?

Yahoo group: V4Protocol
Date: 2011-12-01 21:53:02 UTC
From: Rick Muething
Topic: 2592 Message: 2592

All,

I am still interested in supporting/encouraging a port of the V4 TNC and possibly V4Chat to Linux. I will send the Microsoft VB.NET 2010 source with the only requirement being it must not be released for commercial purposes. I have had some interest in this effort but no real indication of solid progress...It is definitely not a 2 weekend project!

Some thoughts and requirements:
The Mono utility http://www.mono-project.com/Main_Page may be able to help with some of the translation to Linux but there are some possible difficult areas:
1) The .NET version uses MS Direct X and Direct Sound to setup and control the sound card. Those will not likely translate so you will have to generate the following for Linux:
a) Enumerate the installed Sound capture and Playback devices
b) Setup the sound capture device to 48000 sample/sec, monophonic, 16 bits/sample
c) Setup a playback mechanism (12000 samples/sec, 16 bit mono) with a .wav file or (preferred) .wav stream (basically a FIFO .wav file in RAM)

2) There is some tight timing constraints requiring multiple threads and fairly accurate timing (10s of ms)
3) You will need to implement the current third party TCP controls (now nSoftware IPWorks) probably using native Linux client/server TCP ports.
4) The client program will need to control the radio PTT and possibly radio control if all functionality of V4 Chat is desired. Reliance on existing radio control programs will probably not work due to tight timing constraints of PTT apply and release.

The Linux version should be tested against the Windows version (developing some standardized test suite) to insure compatibility with the Windows version and the proper implementation of the V4 Protocol.

The Linux version needs to be documented. Help, user docs, etc.

The Linux version needs to be supported (user questions, updates, enhancements etc.)

As I said I will offer to help, explain and coach but I don’t have the Linux experience, time or resources to do the port and support it myself. If I had to guess I would say one is looking at an effort in the range of 2-4 man months of work providing they are reasonably Linux proficient and know how to do multi threading with real time constraints. If you are serious about such an effort and commitment contact me directly at rmuethingATcfl.rr.com.

73,

Rick KN6KB

2595. MemSet590 -- Managing TS-590S memory settings with a spreadsheet

Yahoo group: V4Protocol
Date: 2011-12-09 19:41:16 UTC
From: Ian Wade G3NRW
Topic: 2595 Message: 2595

The memories in the Kenwood TS-590S can be very useful in all kinds of operational situations, but setting them up through the front panel can be a slow process -- after a dozen or so, you rapidly lose the will to live!

Well, when writing some Excel VBA code recently to handle serial I/O ports, it occurred to me that it should be possible to communicate between the radio and an Excel spreadsheet. The result is MemSet590.

With MemSet590, you can set up an Excel spreadsheet with the settings for all the 110 memories in the radio, then click on the Upload button to transfer these settings to the radio. In the opposite direction, you can click on the Download button, to transfer all the radio's memory settings to the spreadsheet.

Working with the spreadsheet is very simple. No knowledge of Excel is required -- you simply fill out the boxes. You will choose most of the settings through dropdown lists, so very little typing is necessary. There is comprehensive error checking to make sure you don't attempt to upload invalid data to the radio. Also, you can print out the spreadsheet on a couple of sheets of paper, to give you a hardcopy record of all the settings.

MemSet590 is a .XLS program that runs under Microsoft Excel. To install the program:
~~~~~~
1. Create a dedicated folder on your PC -- for example, C:\MemSet590.

2. Go to the TS-590S Resources Page:

http://homepage.ntlworld.com/wadei/ts-590s.htm

3. Scroll down to the "TOOLS" section, then click on the "MemSet590" link, to download the MemSet590 zip file.

4. Unzip this file into your dedicated folder. This folder will now contain a .PDF documentation file and the MemSet590 .XLS file.

5. Read the .PDF documentation for an explanation of how to run the program.
~~~~~~

MemSet590 isn't a program that you will run very often, but when you need it, it will save a large amount of time and effort. I hope you find it useful.

(And it has arrived just in time for U.S. users to set up their new 60m channel allocations!)

(And just what you need for V4!)

P.S. I am now working on a version of the program for the Kenwood TS-2000. Unfortunately I don't have access to a 2000 at the moment, so I will be looking for some beta testers who do have the hardware. If you would like to help, please contact me off list: g3nrw-radio@...

From: Tomas Hood
Topic: 2597 Message: 2600

Also - since I am diving in here... I have some questions.

I assume that I should be in USB. I assume that when you say to be at 10.131, that is my DIAL frequency. That the program will default to the proper place (10.13250, or as it is displaying, CF: 10132.500).

It is in ARQ mode by default. Do I just stay in that mode? I've never found another signal to decode, so I am not sure what to do.

Thanks.

Tomas

The two frequencies usually used on 30m for V4 are 10.131 MHz and 10.136 MHz. These are dial frequencies, USB.

There are some beacons that operate around these frequencies, but they are far enough away from the V4 signal not to cause any problems.

See the 30m Band Utilization Chart at:

http://homepage.ntlworld.com/wadei/30m_band_utilization.htm

Click on "Download the latest PDF version......" for the full picture.

Thomas,

As described in the HELP the monitoring (when unconnected) functions of V4Chat are exactly the same in FEC and ARQ modes. Once connected (ARQ mode) monitoring is disabled and only connected (error free/corrected) data is displayed. For most users seeking and using 2 way (as opposed to NET operation) ARQ mode is easier since it requires no mode switching to monitor or connect.

2608. 20m 14.073 dial - hope to try V4chat, today

Yahoo group: V4Protocol
Date: 2011-12-10 19:54:17 UTC
From: NW7US
Topic: 2608 Message: 2608

I will be monitoring 14.073 dial frequency, CF: 14074.500, USB, today, hoping to catch someone on V4. I've not yet found anyone on this mode. I'm hoping to try this mode and see for myself what it is like. I'm interested in perhaps writing about it in my CQ Propagation column (or perhaps in PopComm). I suspect that it would be helpful to drum up some activity. One of the issued I am having is that the Help documentation does not indicate any frequencies suggested for where people ought to tune on each of the bands. And, searching the messages is not as forth-coming as one would expect...

Here's to hoping...

I've been calling you for several minutes - but no response... Could you have something set up incorrectly?
Just wondering?
73

Subject: [V4Protocol] 20m 14.073 dial - hope to try V4chat, today

I will be monitoring 14.073 dial frequency, CF: 14074.500, USB, today, hoping to catch someone on V4. I've not yet found anyone on this mode. I'm hoping to try this mode and see for myself what it is like. I'm interested in perhaps writing about it in my CQ Propagation column (or perhaps in PopComm). I suspect that it would be helpful to drum up some activity. One of the issued I am having is that the Help documentation does not indicate any frequencies suggested for where people ought to tune on each of the bands. And, searching the messages is not as forth-coming as one would expect...

Here's to hoping...

I hear someone calling, and it shows busy; I have reduced the squelch, but now it is not decoding any text. Before, it was decoding (while I was not here in person). So I think the signal I am picking up is not strong enough??

OK, that time, it decoded KJ5XF, so I called ARQ back to KJ5XF - but the signal coming back faded again.

So, KJ5XF - score was 14, sometimes 27, S/N dB:-20 and we just got disconnected. The QSB fade is slow and deep. I am running about 60w. It does look like a great mode but I think it needs more reliable (less fading on) conditions.

it's cool you guys are attempting an online meta-chat about your QSO attempts, but i really think there are better-suited real-time online communications mechanisms:

1. the K3UK sked page
- http://www.obriensweb.com/sked/index.php?board=digitalradio
or
- http://www.obriensweb.com/sked/index.php?board=lotw

2. IRC irc://chat.freenode.net/##hamradio

(3., 4. and so on .. AOL chat, Echolink, N3GLV's voipqso.com, ..)

have fun!

2619. V4 and V4Chat in 2011

Yahoo group: V4Protocol
Date: 2011-12-11 16:23:19 UTC
From: Rick Muething
Topic: 2608 Message: 2619

Thomas/All,

Thanks for the feedback.

I think it is important to look back over the last year and comment on some things about V4 and V4 chat, where we are in the development and what we have accomplished this past year since we started alpha testing.

1) V4 is the actual protocol. It's documented, can run ARQ or FEC modes and is generally useable down to a level of about −5 to −8 dB S/N (based on the standard 3 KHz Noise bandwidth) over most channels including poor multipath.

2) The V4 TNC is a "helper" program that implements the Virtual V4 TNC...essentially creating the equivalent of a hardware TNC using the V4 TNC software and a common PC sound card. The V4 TNC is set up to be able to be easily used by other programs (V4Chat is one example).

3) V4Chat is the client. It implements all the user interface and text functionality. It determines how you type to send, what and how data is displayed, how you call and answer CQs, the timeouts, radio control, logging, etc. It uses the V4 TNC but any other client could also use the V4 TNC and implement a different user interface. There is no "right" or perfect GUI and V4Chat tries to accommodate most user preferences while keeping things fairly easy to set up and operate (always a challenge!) . What you see now is the result of over a year of Alpha/Beta testing and user feedback...the task is really never done and I am always open to thoughtful suggestions for improvement.

4) It is important I think to understand and maintain the differences between a keyboard oriented protocol and client (one that is normally manned at each end) and what I'll call a message protocol/client where messages are sent and stored and usually at least one end (the server) is unattended. Both those have their uses and fans but it can be difficult or inefficient to make one program do both. For example The V4 TNC could be used in either a simple message system or in a keyboard oriented program like V4Chat but it is difficult, and can be inefficient and confusing to try and do both in one client. There are already a number of message based Clients/Servers that use sound card modes like WINMOR (RMS Express, BPQ32 etc.) ...I don't know that we need any others for the V4 protocol.

5) I want to add some nice features especially for the international users like multi-byte character support (UTF-8) which would support foreign fonts and characters. I also know from experience with WINMOR we can expect incremental but significant improvements in sensitivity and reliability under poor propagation conditions. This is one of the great benefits in doing all the signal processing in the software. But it takes lots of work and testing to gain each dB or 2!

6) I would really like over the next year to be able to support other OS and devices (perhaps some tablets). This is not a trivial effort and any volunteers with experience with Mono (translation of MS VB.NET code to Linux) or expertise in Mac OS or Java and the Android OS would be much welcomed. I am willing to share source code and offer

encouragement but such projects require skill, experience and commitment...it is not a 2 week effort!

Finally, A special thanks to the over 950 in our V4Protocol group that have contributed to the V4 experiment, development and testing this last year. Best wishes to all for a Merry Christmas and Happy Holiday season.

73,

Rick Muething, KN6KB

Hi Rick,

Thanks for that re-cap on the year of V4 !
Yes, its been a very interesting and rewarding process, thank you for all your effort and patience !

My only other comment would be that inclusion in RMS Express would round it off nicely - EMail and Chat in the one package.....

Anyhow, all the very best to you & all the members of the group for the festive season from down under !

Will be watching out for your tones....

In regards to #4 would you entertain a simple file transfer as part of the chat process? The only reason I am asking is that what we need for some Emergency Measure type groups is the ability to simply exchange a text file accurately as well as maintain communications point to point. I have yet to find something that "anyone" can figure out and that's what we are dealing with sometimes in an emergency. In a come as you are scenario if we had a program that we could just type and chat as well as send a text file you'd have my vote. Something that a person can load and use immediately without a huge amount of instruction and so far there is nothing I can find. I know there are programs out there that do just that but they aren't user friendly either.

Anyway I am so happy I found V4... it's a lot of fun. And thanks for all your effort Rick.

maybe i missed something, but couldn't you use the "user files" and
"paste" options to insert your text file? just precede and follow it
with a line of "++++"??

Paul,

Just to bring to your attention if you didn't already know:
1) You can send any text file currently. Just go to "User Files, Paste and send...then navigate to the file you wish to send. It must be a text file (not a .doc or .pdf ...but you can easily change those to .txt). Click on the file and it will paste it into the outbound queue and send. If you are doing emergency work or special forms that file should probably have some preamble info that tells what it is, what it should be used for etc... so the receiver knows what to do with it.

2) On Receive all received text is simply put into the main receive window (and logged to the V4Chat log). But you can currently Copy that text to the clipboard (highlight in the main receive window and right click) and then past that into any text editor and save as a file. A little cumbersome but useable.

To be able to send and receive actual files would require developing a specially formatted file header and footer (so the receiving station would be able to detect the text that is the transmitted file, get the file name etc). That is certainly possible and I will put that on the list to look at later.

Of course sending files should ALWAYS be via ARQ...there is no guarantee FEC transmission alone will arrive error free or complete.

From: John Wiseman
Topic: 2608 Message: 2626

For the record, BPQ32 now has a V4 driver. It is possible to send messages to/from WL2K, altough only in text mode, as V4 isn't 8 bit transparent. This is more a "proof of concept" than a useful faclility, as V4 is really too slow for messaging, but there could be occasions when a narrow band mode could be useful.It can also be used for Chat, but V4Chat is a much nicer interface for this.

73,
John G8BPQ

2627. Re: [V4Protocol] MARS USE OF V-4

Yahoo group: V4Protocol

From: Rick Muething
Topic: 2624 Message: 2627

I just write, debug and maintain the V4 software. (and the WINMOR software)
V4 is a different protocol and mode than WINMOR and is optimized for narrow band (200 Hz) , text-only, keyboard use. V4Chat and V4 TNC will accept MARS call signs.
What is approved, adopted, authorized or used by MARS is up to MARS.

Rick KN6KB, AAA9WK

Hi we think if you talked with your area or regonal wheels and once you explan to them V4 (mode wise etc) they would probably authorize some freqs and nets. What got my attention you refered to a "hassle" using RMS Express. I've never seen or had any hassle with RMS Express. We use both RF ans internet to send reports to our net mgr on a weekly basis and they are always received, on time. 73 Ed AFA5QW

Well there is a reason why a file transfer is required rather than cut and paste into the main body but I do see your point. Yes it can be done that way. In the environment I am used to, we get handed a text file via a computer link and told send this. Multiply that by a hundred files and you can see why it is easier to just sending a file rather than adding several additional steps. Also, and I know this will sound kind of skirting the issue, but with the text file we are used to we prefer not to send them in a clear form... that the other operator cannot easily peruse. As a text file it's a bit more private... I can't give you specifics because of some of the confidentiality of some of the groups we work with. It's a unique set of circumstances we work within.

Yahoo group: V4Protocol
Date: 2011-12-10 12:36:09 UTC
From: siegfried.jackstien
Topic: 2597 Message: 2632

Nost people use arq cause there are absolutely no faults (like in packet ...
if receiving was bad packet is requested again)
If YOU wanna make a cq call click on "arq call" in the chat window
And then on "make cq call" ...
If on the other hand you receive a station in monitor mode and wanna call
that station ... then you type in the others call-sign in the window that
opens after clicking on arq call
On 20 most used qrg is 14073 (as far as I know)
And you should go on k3uk sked page to find other users

Paul,

If you want to send a file (text, .doc, .pdf, .jpg, .xls, etc.) and you want to do it efficiently then just use RMS Express or BPQ32 peer to peer (WINMOR, Pactor 1,2,3 or Packet) . The file can be sent as an attachment and multiple files can be sent with the same message. The other benefit of using this method of sending a text file is that with plain text the compression algorithm used (B2F) compresses plain text about 2:1 (virtually doubling the speed). It also make casual “reading the mail” by monitoring parties difficult...(if you miss any of the compressed file it is very difficult to decompress). WINMOR and P1, P2 operate at 500 Hz BW and WINMOR 1600 or P3 use 1600-2100 Hz of bandwidth. Wideband is faster but requires a better signal to reach max speed.

So my suggestion is if you want or need to send files, use RMS Express or BPQ32 either peer to peer or peer to BBS. If you want to chat in plain text at typical typing speed and use only 200 Hz of BW use V4. Forcing V4 into sending specific files to me is a bit like fitting the square peg into the round hole...sort of like sending pictures with RTTY...possible but why not just send a jpeg?

Rick

I am experimenting with DXLab DXKeeper 9.8.7, and have just successfully imported a V4 ADIF file. The imported log entries show that the mode is V4. No problem.

But if I click on DXKeeper's dropdown list of possible modes, V4 is missing from the list. This doesn't worry me particularly, but it might be an idea to contact DXLab to get V4 added to the list.

V4 is now being adopted into the ADIF standard.

For now, to upload to LOTW or eQSL.cc, change the mode from V4 to DATA or PACTOR.

For LOTW, you can get the TrustedQSL program to perform the mapping for you during the upload.

73, Bernie

2647. Calling CQ (14.073 Mhz) de KJ5XF

Yahoo group: V4Protocol
Date: 2011-12-22 21:39:13 UTC
From: kj5xftl
Topic: 2647 Message: 2647

Folks,
I am calling CQ (V4chat) on 14.073 Mhz. Sure
would like to have a V4chat based qso...
Current time: 21:39 UTC (dec. 22,2011)

Regards,
Tony L. (KJ5XF)

2648. Calling CQ...

Yahoo group: V4Protocol
Date: 2011-12-23 16:33:00 UTC
From: kj5xftl
Topic: 2648 Message: 2648

Folks,
I am calling CQ at 14.073425 Mhz to avoid a Contestia QSO.
So, if you are looking for a V4 QSO, give me a call.

73,
Tony L. (KJ5XF)

P.S. Current time: 16:33UTC

2649. Calling CQ (Moved to 14.073)

Yahoo group: V4Protocol
Date: 2011-12-23 16:48:09 UTC
From: kj5xftl
Topic: 2649 Message: 2649

Folks,
Moved down to 14.073 Mhz. I am calling CQ and also
monitoring.. Where did the V4chat ops disappear?

73,
Tony L. (KJ5XF)

V4. No problem.

But if I click on DXKeeper's dropdown list of possible modes, V4 is
missing from the list. This doesn't worry me particularly, but it might be an idea to contact DXLab to get V4 added to the list.

>>>That's not necessary, Ian; you can add V4 to DXKeeper's Mode selector. See

2651. direct logging to DXKeeper

Yahoo group: V4Protocol
Date: 2011-12-26 06:29:15 UTC
From: Dave
Topic: 2651 Message: 2651

Rick, you can if desired extend your V4 sound card TNC to log QSOs directly to DXKeeper, the logging component of the free-ware DXLab Suite. This is done by sending an ADIF record to DXKeeper via either DDE or TCP/IP. If you're interested, let me know and I'll provide the details.

73,

Dave, AA6YQ

From: JGMAGS
Topic: 2651 Message: 2653

Hello Dave, Happy New Year! I would be interested in knowing how to log from V4 directly into DXKeeper. Would you kindly explain the details on how?

The way I do it now is ti have DXK and DXK Capture running at the same time as V4Chat and manually add the entry into Capture screen and then of course log it through Capture. I'm sure that you know of an easier way.
Thanks, 73, KJ1J John

From: jgmags2000
Topic: 704 Message: 2656

To all V4 users,
When the program was in its development stage many users showed much enthusiasm for the program and many helped with suggestions to help Rick(KN6KB)in arriving at the final revision. Now that that has been achieved, the usage has dropped off considerably. With the increase in band openings there should be much more activity. Rick has worked extremely hard to give us V4Chat so.... with the new year upon us lets try to rekindle that enthusiasm we all had at the outset.

Just my two cents worth.
73 and happy New year

2658. TS-590S Digital HOWTO update

Yahoo group: V4Protocol
Date: 2011-12-28 09:01:24 UTC
From: Ian Wade G3NRW
Topic: 2658 Message: 2658

Most digital packages, such as MixW, Digipan etc produce TX audio tones on both the Left and Right audio channel, but fldigi has the option of producing the TX audio on only one channel. This can cause some head scratching when the package appears to be set up correctly, yet the TS-590S does not transmit a digital signal.

The updated version of my digital HOWTO explains how the Left/Right audio channels are handled by the TS-590S, and how to set up fldigi correctly for operation with the TS-590S.

For the HOWTO, go to the TS-590S Resources Page:

http://homepage.ntlworld.com/wadei/ts-590s.htm

Scroll down to the "HOWTOs" section, then click on the link:

"HOWTO set up the Kenwood TS-590S for Digital Data and Digital Voice Operation "

Pages 4 and 5 explain in detail how the Left/Right audio channels are handled.

Topic: 704 Message: 2659

I tested V4 chat and made two contacts.
I removed the program from my computer because (1) too hard to find users on the air and (2) the program appears to cost $25.
Other modes are easier to use and make all the contacts I want.

Topic: 2107 Message: 2668

Yeah, it would so help if folks would post the frequency on which they
are calling.

I've so far not been impressed with this mode. Not so much in the
lack of users, but, when I do hear users, they seem to be too weak for
this mode to work properly. Under the same conditions, other modes
work much better. Unless something is wrong with my installation, I
think this mode requires PERFECT conditions, and s-9 signals.

Yahoo group: V4Protocol
Date: 2011-12-30 01:46:03 UTC
From: Tomas Hood
Topic: 2107 Message: 2670

In my experience, so far, I have had QSOs start (link established), only to fail after fades occur. I could see the signal on the waterfall, but the modem would not stay connected. I'm using the software as installed "out of the box" -- I have only decreased the squelch, trying to see if that would help. But, so far, this has been rather disappointing. No other mode (Olivia, MT63, MFSK, PSK31, Contestia...) is this touchy.

I've had ONE and only one qso that worked start to end without issue - and the signal was strong with little fading.

Not sure what it is. Perhaps there's something in my settings?? I don't know what to change.

Hi all,
More stations heard in VK3 in last 24 hours - 14073 -
W2KI and K6KAR connected - 14:16 UTC
PD9BTB 14:28
KJ5XF 20:14

And sorry K6KAR - I didnt realise you actually connected to me.....

Still listening 14073 V4 ARQ.

Ive also had some situations where low signals are not decoding, but other times with excellent copy....
Still wondering...
I also have great success with Ham Radio Integrator, but V4 has a much nicer interface.

Cheers and Happy New Year

Paul Whitaker.

2672. Re: Was: Calling CQ, Is: What´s needed to make V4Chat fly

Yahoo group: V4Protocol
Date: 2011-12-30 09:46:05 UTC
From: Peter Zingsheim
Topic: 2107 Message: 2672

Hi,

I second Sigi, I had stable qsos even when waterfall was barely visible, S/N negative, only once lost a connect and that was presumably an operator error or insufficient setup at the other end.

Many thanks to Rick, who made this possible!

I do not think the mode or the protocol or the sw are flawed! No, not in my hands.

I do think, however, V4Chat is limited by insufficient operational conventions. It is still a very young mode.

Imho, there should be ***one single public list of calling frequencies, including continental variants, if necessary, and alternative frequ, if channel is occupied by a qso.***

After all, this is a qso mode, not a mailbox mode, and it will only fly, if more than one freq per band can be accessed. Therefore I suggested a simple button on the software to allow frequ. (or rather channel) hopping in fixed steps compatible with the bw of this mode. In the course of a running qso, qsy can be arranged freely.

I do not think that the message area of this group is a good place to arrange skeds. unless a special facility can be set up using the resource provided by Yahoo (calendar?), I think one of the sites mentioned a while ago will doe, and some links in this group could give directions to users, maybe dedicated to regional or transcontinental needs. Messages should be dedicated to ongoing technical development.

Food for thought?

73, and best wishes for a Happy New Year,
Peter

2673. Re: [V4Protocol] Re: Was: Calling CQ, Is: What´s ne eded to make V4Chat fly

Yahoo group: V4Protocol
Date: 2011-12-30 10:09:53 UTC
From: Tomas Hood
Topic: 2107 Message: 2673

I don't argue with anyone that the mode is working for them. But, I cannot figure out why it is not working well, for me. Given the same band, same conditions, same radio, same sound card, same antenna, same computer, etc., I can QSO with other modes than V4Chat. So, what am I doing incorrectly? Perhaps I don't have things set correctly. I need to find someone with which to trouble shoot.

That is why i asked patrick for adding that mode in his soft
More user would know that this mode exist (cause updating their beloved soft) ... and it would be frequency-agile like all the other modes in multipsk ... now add rs id and call id and its done

What is the timer setting in the modem ???
If you have longer fading times (depends on condition) then it is ok to make the time a bit longer (to stay connected in a fade-out phase)
It does not hurt to make it longer cause that timer is only active if condx are bad ... and if the other station is really gone or condx are gone down absolutely then also the longer timer will count down to zero and cut the link

OK, thank you - I will change my timer setting. Are there any other settings that would help it to decode? Many times with the fading and weaker signal, it just retries and retries. How can that be improved upon?

2678. Re: [V4Protocol] Re: Was: Callin g CQ, Is: What´s needed to make V4Chat fly

Yahoo group: V4Protocol
Date: 2011-12-30 15:45:24 UTC
From: Rick Muething
Topic: 2107 Message: 2678

Peter,

I agree with you and that is one of the reasons for this forum and reflector. I have spend many hours (probably over a man year of effort) on V4 and V4Chat and am continually trying to improve it by performance tweaks and asked for features. I check and verify the sensitivity and robustness of every release on a hardware HF channel simulator on a very poor channel (Multipath poor at −5dB S/N) ... the worst CCIR channel the HF simulator models. Most of the problems people have can be traced to some rather common ones mentioned in the Help files:
RF Feedback to the audio (check the help for suggestions)
Improper PTT keying or timing (latency measured and reported on each CQ or Station call)
Improper Audio drive (Drive to approx 70% of rated PEP output)
Improper Receive audio level (should be in the green preferably about mid scale).
Tuning is automatic within the set tuning range (default +/- 100 Hz)
Not understanding the concept and proper operation of ARQ modes (described in the Help)

I would be more than happy putting a set of recommend frequencies in the help if we can agree on them. I think using the reflector is a good start for that.

Rick Muething, KN6KB

2679. V4 frequencies: a starting point.

Yahoo group: V4Protocol
Date: 2011-12-30 16:36:58 UTC
From: Ian Wade G3NRW
Topic: 2679 Message: 2679

Rick has suggested the inclusion of a list of V4 operating frequencies
in the V4 Help file.

As a starting point, I have been looking back through the reflector
archives. The following dial frequencies (all USB) appear to be commonly
used/suggested:
~~~~~~
160m ?

80m 3.573 (also somewhere between 3.620 and 3.640 in VK)

60m ?

40m 7.045 (7.073 is commonly used by strong SSB stations in Region
1)

30m 10.131, 10.136 [1]

20m 14.073 (but Hellschreiber QRM is common. Maybe higher?)

17m 18.073

15m 21.073

12m ?

10m 28.073

6m ?

2m ?
~~~~~~

Anyone care to fill in the blanks, or suggest alternatives?

[1] See the 30m Band Utilization Chart:
http://homepage.ntlworld.com/wadei/30m_band_utilization.htm

It is the receive that has the problem; I can be monitoring other stations in QSO, and only get partial decode, at best.

Tomas,

If you are monitoring an ARQ QSO you will likely not get all the QSO since you cannot request a repeat while monitoring as the connected station can. The V4 Software should filter out repeats (so they don't duplicate on the printing) but when monitoring it depends on how good the signal is as to whether it will capture and tune and how many errors are present.

You should be close to the frequency ...the monitored signal should be near the center of the waterfall. Make sure the V4 TNC's internal filter is IN (see the help) and it may help to use a narrow (200 Hz or greater) filter on receive if you have one (centered on the signal). Your AGC should be fast to medium and the signal level on the V4 TNC receive level indicator should be "in the green".

The received signal offset should be fairly close as measured by the freq offset on the TNC ...definitively must be < the tuning range you have selected. Note of course when monitoring you must be able to auto tune to BOTH stations of the QSO.

Also note you have some control over the leader detection threshold...that is the DSP logic that detects and tunes the two tone leader signal at the start of every frame. Setting the squelch to values of 3 or 4 will make it more sensitive but also occasionally "trip" on noise. See the help re the Squelch setting.

73,

Rick KN6KB

From: Tomas Hood
Topic: 2107 Message: 2682

Well, I have egg on my face; I am sure, now, that my newby status is in plain evidence. My receive audio level, while great for all other modes, was not in the green for the V4 modem. It was just under. So, I am increasing my receive audio to place it about 1/3 in the green. Now I just await someone on 14.073 whith whom I can make a QSO.

Thank you for such simple and timely help.

2684. V4 1.0.1.0 -- frequency bug with TS-590S

Yahoo group: V4Protocol
Date: 2012-01-02 21:33:58 UTC
From: Ian Wade G3NRW
Topic: 2684 Message: 2684

Rick

You may recall some time ago I suggested you use the "IF" CAT command instead of the "FA" command to read the VFO frequency.

Well, with the TS-590S I have just stumbled across a situation where "FA" definitely gives the wrong answer on the V4 frequency display. This arises when you select a memory on the radio. The display frequency on the radio changes to the stored frequency, *but "FA" does not change*.

For example, if the VFO was originally at 14.073, then you select 28.073 from a memory, the V4 frequency display remains at 14.073.

This is a bug. To fix it, you need to get the frequency with the "IF" command instead of "FA". The "IF" command gives you the *displayed* frequency, which is not necessarily the same as the VFO frequency. I had to read the "PC Control Command Reference Guide" very carefully to appreciate the difference.

Now I understand why Simon HB9DRV uses "IF" not "FA" in HRD.

I suspect the same bug will apply to other Kenwood radios as well.

Understood, but you still need to display and log the frequency that is
actually in use by the radio, irrespective of whether it is a memory
channel or not.

2696. Is there a LINUX version ?

Yahoo group: V4Protocol
Date: 2012-01-18 10:49:10 UTC
From: g3zxx
Topic: 2696 Message: 2696

Hi All,

As you might have already guessed, I run LINUX. Specifically MINT 12, which is basically a derivation of Ubuntu.

Very NEW to the group, so I'm very sorry if I'm going over old ground, or I've missed something.

I've had a quick search through the messages, and found a couple of references to Linux, but not been able to determine if there is a Linux variant.

I note that there is no specific download for it.

Is there a Linux version ?

Is anyone working on a Linux version ?

Is it not possible to migrate it to Linux ?

Any constructive feedback would be much appreciated.

Cheers & 73's
Dave, G3ZXX.

Dave,

There is currently no Linux version though I have shared the Microsoft VB.NET 2010 source with a Linux developer. The issue is it is a significant task to 1) Convert the V4 TNC to Linux and verify it is a correct implementation of the V4 Protocol and 2) Create a Linux based client like V4Chat to use the TNC. Mac users have had success using Parallels on late model Apples but that doesn't apply to Linux. If there are SERIOUS (read skilled and committed!) Linux developers that want to work with the VB.NET source I will be happy to send it to them and help some but I don't have the time to run a DSP programming school and I insist that any porting effort be supported so Linux users are not left with unsupported programs.

Dave,

I am willing to work with any serious Linux developer by sharing the VB.NET 2010 source and helping with development questions. What is needed however is committed (I would estimate about 3-6 man months required if the programmer can read the VB.NET and has some DSP experience). But another important requirement is a commitment for on-going support which is never trivial on these complex evolving DSP programs.

I don’t have the time or Linux experience to do the Linux port myself but I am willing to help, and encourage.

2703. Announcing the 160m Band Utilization Chart - 26 Jan 2012

Yahoo group: V4Protocol
Date: 2012-01-26 09:28:34 UTC
From: Ian Wade G3NRW
Topic: 2703 Message: 2703

Announcing the 160m Band Utilization Chart - 26 Jan 2012, at:

http://homepage.ntlworld.com/wadei/160m_band_utilization.htm

The "160m Band Utilization Chart" is exactly that. It is not a "bandplan", nor even an "unofficial bandplan". Rather, it is an attempt to graphically portray the modes that are actually in use on 160m today.

The chart does not tell you where people *should* operate. It tells you where people actually *do* operate.

Although the essence of the chart is to show actual use of the band, the bandplans for each of the three IARU Regions are also included for reference, as they differ significantly in some respects between the regions.

There is a clear distinction on the chart between dial frequencies and emitted frequencies, helping you to accurately set the correct frequency and to identify signals as they appear on the waterfall.

This release is very sparse, and I know it could do with improvement. Please study it carefully, and if you spot any errors or omissions, please let me know as soon as possible, to

mailto: g3nrw-radio@...

In particular, I would like to know details of any other digital activity on the band (including MT63, Throb, Hell, Olivia, MFSK16 etc). And V4, of course!

If you are interested in digital operation on 160, you should join the new Top Band Digital Group (TBD160) to keep up to date with current thinking:

http://groups.yahoo.com/group/TBD160

And if your preference is for 30m operation, there is a similar chart at:

http://homepage.ntlworld.com/wadei/30m_band_utilization.htm

From: Peter Z.
Topic: 2703 Message: 2704

Ian,

mni thanks!

Looking at the charts, plus realising that they are "as is" and not "should be" charts, it dawned on me how much effort, dedication and how many hours must have gone into them!

Extremely valuable!

Being a less than casual digital op, I can´t much contribute to keeping them up to date, I´m afraid.

Let´s hope that V4 will stand out from the charts, sooner or later!

Cheers, 73, Peter Z.

2705. Re: V4 CHAT

Yahoo group: V4Protocol
Date: 2012-02-14 13:25:53 UTC
From: Daniel V. Wolff, Jr.
Topic: 704 Message: 2705

The Holidays have passed and I've been hoping to find more V4 stations active. There has been some on-the-air V4 activity but not anywhere near what I might have expected after the Holidays. Perhaps what we need is a little more publicity. It would be nice to see the V4 modem included in 3rd party programs, such as FLDigi, MultiPSK, and others. At the same time, it would be nice to see an annual on-the-air event (i.e. V4 QSO party, V4 Roundup, etc.) to promote this mode.

Just my open thoughts on the subject. Even our V4-Chat Yahoo group has been rather quite.

To all V4 users,
When the program was in its development stage many users showed much enthusiasm for the program and many helped with suggestions to help Rick(KN6KB)in arriving at the final revision. Now that that has been achieved, the usage has dropped off considerably. With the increase in band openings there should be much more activity. Rick has worked extremely hard to give us V4Chat so.... with the new year upon us lets try to rekindle that enthusiasm we all had at the outset.

Just my two cents worth.
73 and happy New year

Daniel. I agree. I wonder if V4 could be downloadable outside the yahoo group. Maybe from the Winlink web site. Needs easy distribution I believe. 73 de LA7UM Finn

2707. Re: [V4Protocol] Re: V4 CHAT

Yahoo group: V4Protocol
Date: 2012-02-14 19:27:41 UTC
From: Rick Muething
Topic: 704 Message: 2707

Daniel,

I agree with you in it would be nice to see some additional V4 activity. I will look into also providing a download capability for V4Chat on the WL2K FTP server in addition to the Yahoo server.

Some other points and issues:

1) I have a lot on my plate at the current time. The WL2K software needs important updates (RMS Express, RMSTrimode etc) and Vic Poor one of our major programmers is leaving on a year's sabbatical so the other volunteer programmers have to cover and handle any issues/updates to Vic's code. This leaves little time for additional V4 Programming right now.

2) The V4 TNC is documented and available to other developers to use. It is fairly easy to integrate (similar to a hardware TNC or the WINMOR virtual TNC). I would be more than happy to provide some limited help to other developers that want to integrate V4 into new or existing client programs. This has been done for WINMOR on a number of "3rd party" programs with success. The effort is roughly equivalent to writing a TNC driver.

3) I think a V4 contest or "roundup" would be a great idea. The logs (if the ADIF log is enabled) is compatible with most programs that can read ADIF formatted logs and that could make "scoring" the contest easier. Since grid squares are exchanged automatically on a connection something that encouraged how many grid squares worked might be fun and easy to do. I think there are plenty on the V4 reflector that could help with this. I can offer only limited time and support.

4) I still remain more than willing to provide help with any SERIOUS Linux programmer that wants to port V4 and/or V4Chat to Linux. I will supply the V4 VB.NET 2010 source and it may be possible to convert most of this if someone is familiar with Mono. My only requirements are:
a) This has to be a serious effort...It is probably a few man months...it is not a one-weekend re compile.
b) The resulting product has to be documented and supported. I don't want any unsupported V4 code out there... (Support means things like Help files, answering questions and fixing bugs).
c) The resulting Linux V4 program needs to be checked and verified that it is compatible with the current Windows V4 version and matches the V4 protocol.
d) This will require the Linux programmer be familiar with things like: DSP (FFT, wav files, sound cards etc), Real time programming, Multi threading. I just don't have the time to run a programming school especially in Linux. There is a CD of a DSP short course I did for TAPR at the 2010 DCC that some may find good if they have minimal DSP experience. See the TAPR web site (
http://www.tapr.org/pdf/DCC2010-DSPcourse-session1-KN6KB.pdf) for more info.

73,

Rick KN6KB

[Snip]

I have just realized I included the wrong URL for the HHD Serial Monitor
in my HOWTO. The URL points to the paid-for version of HHD, whereas I
had intended to point to the free version.

The free version is available at:

http://www.serial-port-monitor.com/

There is no trial limit. I have been using it since last September,
without any request for payment.

The free program is called "free-serial-port-monitor.exe". The full
version is called "serial-monitor.exe" and is almost twice as big as the
free version.

2711. V-4 HAS STOPPED WORKING

Yahoo group: V4Protocol
Date: 2012-02-20 23:38:25 UTC
From: K4PDW
Topic: 2711 Message: 2711

Need help,
After several months away from V-4 I thought I would try it again on vhf.
Well it turns out that it has stopped working..My computer has gotten slower and a popup states that it can not continue "ie" When JIT debugging is enabled, any unhandled exception will be sent to the JIT debugger registered on the computer
rather than be handled by this dialog box. I know something has changed
....I can make test from the TNC but when i try to send a message the popup blocks V-4 ..I have the option of continue or close.Trying to continue will not get me anywhere. Any ideas, I liked MY V-4 just the way it was ...Maybe a early version will work HELP!
BTW, I'm using Windows XP Pro.

A few basic questions.
1. Do other functions work on your PC normally? If not, perhaps you have malware on your PC? Did you recently install any new updates? If so, roll these back if you can.

If your PC is normal other than V4, try re-installing V4. You can contact me off this list if you are still stuck. Programs just don't stop working without a good reason. :-((

My experience with computers indicates that slow response usually means not enough memory or you just have too many processes running.

For XP and XP Pro you need 750Mb for decent response
For Windows 7, you should have at least 2 Gb of memory...

Even an old computer can get a boost by adding more memory; memory is very cheap now; I bought 1Gb of used memory for $15.00 at a local computer store a month ago.

2724. Update to Digital HOWTO: 5 March 2012

Yahoo group: V4Protocol
Date: 2012-03-05 18:39:06 UTC
From: Ian Wade G3NRW
Topic: 2724 Message: 2724

I have just updated my digital HOWTO to version 1.5. Apart from some minor amendments, there are two new appendices that answer the questions:

1. How do I prevent Windows "sounds" appearing on my transmissions?

2. How do I monitor USB device status?

Although the HOWTO is aimed specifically at the Kenwood TS-590S, these two appendices contain material that is relevant to almost any transceiver.

To download the HOWTO, go to the TS-590S Resources Page:

http://homepage.ntlworld.com/wadei/ts-590s.htm

Scroll down to the "HOWTOs" section, then click on the link:

"HOWTO set up the Kenwood TS-590S for Digital Data and Digital Voice Operation".

2729. About latest Version?

Yahoo group: V4Protocol
Date: 2012-03-06 20:46:31 UTC
From: Î□Ï□Ï□Ï□Î±Ï□
Topic: 2729 Message: 2729

Hello
Version 1.0.1.0 is the latest one? Is any website where we can visit for new versions or only via file section of this reflector?
73 Costas SV4FFL

2730. Re: [V4Protocol] About latest Version?

Yahoo group: V4Protocol
Date: 2012-03-06 21:15:33 UTC
From: Rick Muething
Topic: 2729 Message: 2730

As described in the help the program is auto updating and will (if enabled) auto update to the latest version. The latest version is also always on the V4 reflector files page as it always has been for those that can't/won't auto update.

I am not aware of any serious bugs currently. I am presently swamped with some other software tasks relating to Winlink (WL2K) and WINMOR but if something serious shows up I will try and fix it.

2732. MemSet590 updated with new U.S. 60m channels

Yahoo group: V4Protocol
Date: 2012-03-12 01:28:11 UTC
From: Ian Wade G3NRW
Topic: 2732 Message: 2732

MemSet590 is an Excel program that lets you automatically set up the memories in the Kenwood TS-590S. Once you have defined the memory settings in the spreadsheet, you can then click on the Upload button to transfer these settings to the radio. In the opposite direction, you can click on the Download button, to transfer all the radio's memory settings to the spreadsheet.

MemSet590 has now been updated with the five new U.S. 60m channels, following ARRL's Recommended Practices for 60m. Otherwise the program is unchanged from the previous version.

To install MemSet590:
~~~~~~
1. Create a dedicated folder on your PC -- for example, C:\MemSet590.

2. Go to the TS-590S Resources Page:

http://homepage.ntlworld.com/wadei/ts-590s.htm

3. Scroll down to the "MEMSET590" section, then click on the links to download the program and documentation files.
~~~~~~

2733. Error message from WIN7

Yahoo group: V4Protocol
Date: 2012-03-18 23:52:55 UTC
From: la7um
Topic: 2733 Message: 2733

Hi, a buddy has got the file, accepted by Norton and Norman, but his WIN7 sais:"this file appears to be harmful to your computer and is therefore blocked".

He tells me that it doesn't help lowering level on his firewall and shield either.

So far he has not told me more about details.

I have XP Home at home, and have no problem. I am unfamiliar with WIN7

Any ideas?

73. Finn/LA7UM

In WIN7 files that are potentially dangerous (.exe, .zip, etc) that are received by email are set by properties to be save. You simply go in and change the properties that allow them to be opened (eg. for zip files).

Finn,

He is not looking at or reading about permissions in Win 7

This should apply to all Win 7 versions I believe.

On the zip file as received via email.

1) Save the file to a working area ...some scratch directory.
2) Bring up the file explorer and right click on the zip file and select properties
3) The properties window should have 4 tabs General, Security, Details, Previous Versions
4) On the General tab if the file has been blocked at the bottom is a Security notice: “This file came from another computer and might be blocked to protect this computer” Click on the Unblock button. Then Apply and OK This will remove the block and permit unzipping.

Rick. Your 4 point directions made wonders. Thanks. Next step..puh is getting him download RMS Express as well, and try reseach towards the unmentioned TS590.

I find IC 7200 in setup (as we use in RMS WINMOR) mentioned, but not the Kenwood TS590 and not IC 7600 either. But I have heard about other norwegians running WINMOR on both those two rigs without any external SignaLink, so it probably works equally well with the the other similar radios and also on V4.

My guess is just download driver from Kenwood web site, like from Icom web site.

Then name the rig Kenwood, and look out for some added USB CODEC?

Hello Martin,

tonight I tune my transceiver on 3590 kHz USB (Dial). V4Chat is stand by in order to receive CQ-Calls. Anybody is welcome to connect me in ARQ-mode. Just try.

Hi,

tonight I had on 3950 kHz qso with ON4KVI, OH5RM-10 an OH6XI. M0SFR and IK2MXM tried to connect me. However after some seconds the connection broke down. My noiselevel was S7 - S8 caused by som tv sets. Thanks to all who had qso with me or tried to connect me.

2745. ARQ timeout ???

Yahoo group: V4Protocol
Date: 2012-03-24 19:50:31 UTC
From: sp5isz
Topic: 2745 Message: 2745

Greetings,

Some months ago I tried my luck with V4 on Kenwood 480, but results of T/R latency measurements were not satisfactory. Now I try on a different radio (ICOM 703) and different computer, using G4ZLP interface. My attempts to call ARQ CQ end after 6 transmit cycles with the following message:

DISCONNECTED ARQ Timeout. Outbound buffer purged at <timestamp here>

What the heck? Radio or computer too slow? I was unable to find meaning of the message in help file. Does anybody know why I got it?

73, Marek sp5isz

Marek, your program is operating perfectly. That is the way it is supposed to work. Nothing wrong with it or your rig. If anyone hears your CQ, they then can/will answer. Good luck!

2747. How about a YouTube demo?

Yahoo group: V4Protocol
Date: 2012-03-24 21:20:17 UTC
From: w0aew
Topic: 2747 Message: 2747

Has one been done? I've "connected" with stations but neither of us actually exchanged any messages. Seems simple for those who already know, but I don't know if I'm missing a step or if the connection is too poor to proceed. I've had similar experiences with the ALE system (can connect but the link eventually times out...unable to proceed further). I've been told that was due to slow switching of my TenTec Argonaut V, that my computer is too slow, etc. etc.

Anyhow, a quick YouTube video would clear up some of these issues.

After V4Chat advanced from version .5.1.9 to .5.2.x.x the software has performed flawlessly on an old FT900 Yaesu. My latency averages from 17 to 80. It's a sweet little program and works great for long-winded ragchew sessions. If anything is going to be the problem, it will more than likely be too slow of a keying relay. When you are calling CQ, pay close attention to what the latency is reading. The help files suggest that a latency less than 250ms. 20 meters is a fairly good place to hang out on 14,073 and 14,074 during daylight hours as long as there are not any weekend contests. I have had several 45 minute qsos on V4Chat with hardly any repeats. This mode along with ALE400 are making for some nice long-winded keyboard chats. Whatever you do, do not give up on V4Chat because one you get some good band condtions, you will have trouble find frequency space to squeak i n a contact.
I'll be listening on and off throught daylight hours on 14073 during the weekends.

Almost any modern computer and radio should run V4CHat and the V4 TNC. Slow “switching” is almost always caused by:
1) SignaLink USB or similar sound card/interface with the DLY set too long. Should ALWAYS be set to minimum for V4 and WINMOR
2) Using your radio’s VOX with its Delay or “Hold” control set too high. Again set to minimum as the help file describes.

The Latency is automatically measured by the program when you call a CQ or other station. Any latency measurement under 250 ms will be fine.

Many newcomers to V4 are not familiar with ARQ modes and how the “link” is turned over. Its fairly simple and described in the V4 Chat help.

I will always try and answer questions but I am pretty swamped right now on another project. Hopefully will have time this summer to work on some V4 enahancements.

73,

Rick Muething, KN6KB (V4, WINMOR Author)

The Kenwood TS480 has a vox delay. Push in the keyboard number 6. Set the vox delay to zero. I was surprised to learn that the vox delay works for digital modes, and also is handy for sending c.w. using my amplifier. For other digi software that has an RSID, you will probably have to re-set the vox delay as there is a little break in the transmission before the text starts up.

2757. Neat Program!

Yahoo group: V4Protocol
Date: 2012-04-09 03:48:40 UTC
From: ab9ta
Topic: 2757 Message: 2757

Just had my first V4 ARQ QSO with NR5G on 14.072 (Thanks Lee!) and things went pretty well in spite of my cockpit errors. I haven't had so much fun since I used AMTOR in the 80's. This is a very slick program..

I have a few questions though..

1. How do I get QSO's into the log?
2. I've configured the radio control for my TS-2000, but it doesn't seem to make any difference in the operation of the program.. I know the COM port works as I use it for other programs such as HRD, AirLink, MMSSTV, etc., and it works fine.. I have it set for radio control on one COM port and PTT on another.
3. I know 14.073 and 21.073 are two common frequencies, but how about the other bands?

A couple of suggestions,
1. Can the waterfall/tuning display be made larger? It's a little too hard to see on my current screen resolution.
2. It seems like the ARQ CQ only sends 5 CQ messages, could that be adjutable to a larger number of tries? This would help for getting the mode going where one could just set it to CQ for a longer period of time without needing so much human intervention.

All in all, I'm really looking forward to using this mode a lot more. Thanks for a really cool and easy to use program!

Bill,
Thanks for your feedback.
I will try and answer some of your questions. The program has been pretty stable for the past several months and I am still currently tied up on some other tasks unless there are serious problems or issues.

1) Every QSO should go into the ADIF log. If you need an ADIF log viewer there are some recommended in the Help file.

2) The TS-2000 should work but mine is currently tied up so I can’t verify here. How are you keying the TS-2000. There have been reports of problems of using program PTT (via the control port) with the TS-2000.

3) We use this reflector to co ordinate “watering hole” frequencies. I would suggest posting to the reflector when you are going to be operating and choose a frequency in the digital band segment (not in the wide band auto forward segment) and posting on the reflector.

4) The waterfall is a fixed size so it matches (Pixel for FFT frequency bin) the program to minimize CPU loading. It would be complex and cause artifacts to allow it to be scaled. There is no need to tune precisely as with other modes. If you are within about a hundred Hz V4 will auto tune. You can increase the auto tuning range from +/- 100 Hz to +/- 200 Hz in the setup menu.

5) The CQ length is currently fixed as a good compromise between getting a connection and causing unnecessary interference. I can look into making it variable if others believe that is a useful thing. The program however is designed to be “manned” and not run unattended.

Thanks again for the feedback. I hope to have some time this summer to crank in some more capability and improve the performance of the V4 Protocol.

73,

Rick KN6KB

I just had my first chat on V4. Great fun. I have been on the group for some time and learning while the bugs were being worked out.

I am currently on 14.073 and hearing a bit of traffic. Hope to hear from some other stations soon.

2764. Announcement -- TS-590S TechNote: SSB Audio Handling v1.0

Yahoo group: V4Protocol
Date: 2012-04-22 06:55:26 UTC
From: Ian Wade G3NRW
Topic: 2764 Message: 2764

TS-590S TechNote: SSB Audio Handling v1.0
==========

I have posted a new TS-590S TechNote on the TS-590S Resources Page.

The aims of the TechNote are:
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
-- To summarize the many features built into the TS-590S for handling SSB audio.

-- To dispel some of the myths and misunderstandings arising from Kenwood's inappropriate use of the word "DATA" in its documentation.
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Emphasis is on the *functionality* of the TS-590S, describing what the radio does, rather than how to operate it. For the most part, this document is not a HOWTO (although it does include step-by-step instructions for setting up TX and RX audio equalizer profiles using the ARCP-590 control program).

The TechNote also includes detailed information on how TX keying works, insofar as how it determines which audio input the radio uses when transmitting.

The document is a long one: 28 pages. Please take the time to read it thoroughly. It should present a consistent picture of how this wonderful radio works, and will hopefully clear up some of the misconceptions that have appeared on the reflectors from time to time.

I must acknowledge the people who reviewed early drafts of the document: Steve London (N2IC), Frank Riley (KK0K), Don Snodgrass (KG9OM), Rob Stampfli (KD8WK), Joe Subich (W4TV) and Jose Maria Trueba (EA2JX). Their contributions helped me turn the very rough first draft into something much more readable. Many thanks gentlemen!

To download the TechNote, go to the TS-590S Resources Page:

http://homepage.ntlworld.com/wadei/ts-590s.htm

Scroll down to the "TECHNOTES" section, then click on the link:

"TS-590S TechNote: SSB Audio Handling".

As usual, if you find any errors in the document, or anything that isn't clear, please get back to me.

Wade,

Than you ...I'll try and read this in detail. It is something I have been looking for. It's a shame such potential radios as the TS-590 and IC 7200 with built in sound card capability are not well documented by their manufacturers.

Ian,

I just had a chance to start reading the above document. EXCELLENT job on a much needed document. I will take some time and try and read through it all today .... I may have a question or two that would help me right the correct driver for the radio.

In general what do you think of the TS-590 and have you compared it to the Icom 7200? We have had access to a IC-7200 for a while and it works well with the built in sound card (though I have to say the Icom documentation for that is next to nothing)... It seems almost like they (Icom...I think Kenwood is better) don't really quite understand (or at least promote) the value that these radios offer in terms of simple connections and minimizing RF contamination of the audio. I am trying to obtain a TS-590 that we can use for testing in WL2K and I think we can handle it from some of our corporate donors (www.arsfi.org)

One thing I would be interested in too is if you have made any measurements (they aren't easy to measure) of the sample rate accuracy of the built in sound card. I suspect Kenwood and Icom are using a generic USB CODEC sound chip and many of these are designed to use a cheap xtal oscillator which is often not too accurate (or particularly stable) My tests on several low cost "USB plug in sound cards" showed a range of +/- 2000 ppm and sometimes worse. But the average was usually better say +/- 200-400 ppm. Strangely (I think it is a function of how the sound card chip creates the sample time base (or decimates the samples) the accuracy varies widely on the same chip/sound card depending on the sample rate. For example we found the "cardinal" sample rates of 12000, 48000, 96000 and 192000 were most accurate (typically +/- 400 ppm) but the other rates like 8000, 11025, 22050 and 44100 were sometimes much worse (up to +/- 8000 ppm in some cases). The SignaLink USB fell into this category and was one reason I changed the initial sample rate in WINMOR which was 8000 initially to 48000/12000. While such errors go almost unnoticed in things like voice for some DSP work like multi carrier PSK decoding they cause very big problems and can take a lot of CPU resources to correct especially over a wide audio bandwidth using multiple "carriers". To put in perspective the SCS modems (great but costly!) have a master time base in the +/- 10 ppm range...There is a reason they went to that trouble and expense.

I have been keeping up with (and making occasional contributions to) the work on a open source Voice codec (good voice quality at about 1200 bits/sec and 1500 Hz bandwidth). This is being done by David Rowe in Australia and it would be a perfect fit for a radio like the TS-590. David has achieved better performance than the proprietary CODEC used in the D-Star radios and I think will soon have the matching HF Modem ready for initial beta testing.

Again great work on the much needed document and thanks for providing it!

Rick

My thoughts on the TS-590S tally very closely with most of the reviews on Eham -- in other words, I am extremely happy with it all round (but especially the receiver, which is outstanding for a radio in this price bracket). I have no experience of the IC-7200, so I can't offer any comparison.

>

[Snip]

No, I haven't made any detailed sample rate accuracy measurements with the TS-590S or PC sound cards. That is something I want to look at in more detail. I have not played much with low-level signals or multiple carrier signals on this radio, where sampling accuracy can obviously make quite a difference.

>
>
>I suspect Kenwood and Icom are using a

The TS-590S uses the PCM2903B stereo audio CODEC:

http://www.ti.com/lit/ds/symlink/pcm2903b.pdf

Thanks Ian,

If I recall there is a fairly simple utility in Mix W that does a fair job of estimating Sound card sample rate. It uses the internal clock of the PC To calculate sound card sample rate over many thousand samples to get some form of a long term average. I guess the typical reference clock (time of day clock) in the PC is more accurate than typical sound card sample rate clocks and you get fairly repeatable results with this utility. Its probably not as good as using WWV or precision references but its easy to use and set up. I'll try and run some tests on the 7200 later in the week.

When I open up my signalink it has a PCM2904 in it. I have looked at both the PCM2903a and PCM2904 spec sheets and the only differences I see is one works and 3.3 volts and one works at 5 volts.
Rick if you were to port the 590 to the trimode you would need toggle menu 63 to the port you wanted to transmit on acc for pactor and usb for winmor. You would also have to have menu 69 on for data vox for winmor to work. You could also get into the filters also. I have RMSE working on both Winmor internal sound card and Pactor with a SCS ProII on the acc port the will both receive at the same time. Winmor works great on the 590.(V4 also!!!)

2777. New TS-590S HOWTO: Digital QuickStart

Yahoo group: V4Protocol
Date: 2012-05-03 20:46:43 UTC
From: Ian Wade G3NRW
Topic: 2777 Message: 2777

When writing my SSB Audio Handling TechNote recently, I wanted to check out some of the more well-known digital communications packages to make sure they worked as expected. I made some brief configuration notes as I went along, and I have now put these notes into a new HOWTO.

Go to the TS-590S Resources Page:

http://homepage.ntlworld.com/wadei/ts-590s.htm

Scroll down to the "HOWTOs" section, then click on the link:

"TS-590S HOWTO: Digital QuickStart"

The notes for each package are very brief, but hopefully just enough to get started.

2778. TS-590S HOWTO: Remote Operation (with a twist)

Yahoo group: V4Protocol
Date: 2012-05-07 08:08:41 UTC
From: Ian Wade G3NRW
Topic: 2778 Message: 2778

I have posted a new TS-590 HOWTO on Remote Operation. Go to the TS-590 Resources Page:

http://homepage.ntlworld.com/wadei/ts-590s.htm

Scroll down to the end of the "HOWTOs" section, then click on the link:

"*** TS-590S HOWTO: Remote Operation".

The HOWTO has full details on setting up the TS-590S for remote operation over the internet, using Skype and TeamViewer.

The twist? The HOWTO also describes the capability of the TS-590S to send monitored sidetone audio along the same path as the RX audio. This means that from the comfort of your local PC you can listen to the radio's TX Monitor, letting you check and adjust the quality of the TX audio in (more or less) real time -- no more guessing how your signal might sound thousands of miles away!

2779. TS-590S Digital QuickStart -- major update to v1.2

Yahoo group: V4Protocol
Date: 2012-05-25 16:41:51 UTC
From: Ian Wade G3NRW
Topic: 2779 Message: 2779

It seems that the original version of the TS-590S Digital QuickStart was
just a little too quick for some people! So I have now considerably
expanded it.

The main changes include:
~~~~~~
* Added explanation of VOX and CAT TX keying

* Added MixW configuration details

* Added VOX setup details for several packages

* Added requirement for Fldigi TS-590S XML file
~~~~~~

Thanks to everyone who contributed useful feedback.

The QuickStart is accessible through the TS-590S Resources Page:

http://homepage.ntlworld.com/wadei/ts-590s.htm

Scroll down to the "HOWTOs" section, then click on the link:

"TS-590S HOWTO: Digital QuickStart"

2780. V4 Chat? Anybody Up?

Yahoo group: V4Protocol
Date: 2012-05-28 19:30:14 UTC
From: Rick Westerfield
Topic: 2780 Message: 2780

Hello,

I'm monitoring 14.086 dial / 14.0875 CF if anybody wants to do a little V4 Chat. It has been a while since hearing it on the bands.

Rick KH2DF

Interest in V4 seems to have waned. There was a lot of activity last summer but now, every time I listen on 14073, there are no V4 QSOs.

Consider using K3UK's SKED page if you are listening on 14073.

2791. V4 Chat and V4 TNC update to 1.0.2.0

Yahoo group: V4Protocol
Date: 2012-06-16 16:24:33 UTC
From: kn6kb
Topic: 2791 Message: 2791

All,

I have been working on some enhancements for improved senitivity and robustness using some new DSP code (Square Wave correlation).

This new version also includes support for the newer radios with built in sound cards/interfaces like the TS-590S or the IC-7200 or IC-7600.

I have posted the full install on the V4 group web site along with an auto update from version 1.0.1.0. Your settings should not be lost with a new install.

I will be avaialble this week for testing on 40 meters, 30 meters, 20 meters, and 17 meters.

Rick KN6KB

2798. TS-590 USB Data Mode

Yahoo group: V4Protocol
Date: 2012-06-17 11:59:52 UTC
From: Ron Wenig
Topic: 2798 Message: 2798

Hi Rick,

I have a Kenwood TS-590 radio and I am using V4 Chat version 1.0.2.0. In the radio setup I have USB Data selected. When the program switches frequency it will also switch the radio's mode to FSK instead of USB Data. When I select USB the radio will switch to USB then I have to manually select Data mode on the radio. Is this because the program is sending the wrong command to the radio.

Ron,
I probably missed something. I used code from another application for the TS-590S. It should be USB digital and it also has to switch the internal mux from Aux to USB sound card input to the radio. I'll check it out ...may be a day or two. I have a TS-590 here just not currently setup.

Thanks Rick,

The new version works great with the TS-590. I am now using a serial cable for rig control and PTT control and the USB port only for sound. I am getting TR Latency about 40 to 70 ms and the CW ID keying mode sounds much better than the modulated mode.

2803. Re: [V4Protocol] TS-590 USB Data Mode

Yahoo group: V4Protocol
Date: 2012-06-18 01:22:25 UTC
From: Rick Muething
Topic: 2798 Message: 2803

Ron,

I found several problems in the code for the TS-590S (a result of not checking the patched in code from another project!) There were also several errors in the Help for the setup. I have it running fine now here on my TS-590S. There is no need for a serial cable for PTT control ...the new code will correctly control the PTT though the normal USB port and set the internal mux of the TS-590S to select the USB sound card output as well as put the radio into the correct mode of USB Data. I will get an update out for this tomorrow along with the updated help.

Rick

Thanks Rick,

The new version works great with the TS-590. I am now using a serial cable for rig control and PTT control and the USB port only for sound. I am getting TR Latency about 40 to 70 ms and the CW ID keying mode sounds much better than the modulated mode.

2805. V4 Chat 1.0.3.0 Update

Yahoo group: V4Protocol
Date: 2012-06-18 12:16:09 UTC
From: Rick Muething
Topic: 2805 Message: 2805

Thanks to all those that reported the problems with the 1.0.2.0 update (Radio driver for the TS-590S and help). I have fixed these and verified operation here on a test TS-590S. The Help is also updated to support the IC-7200, IC-7600 and TS-590S. The latest V4 TNC version is still 1.0.2.0.

The full install has been uploaded to the Yahoo V4Protocol server files session and the Winlink user programs download FTP ftp://autoupdate.winlink.org/User%20Programs/ (refresh your browser window if you don’t see the V4 Chat 1.0.3.0 full install)

73,

Pat, Michael,

The ARQ mode is preferred when working between two stations. It will insure error free copy (unless of course the link is so poor it just gets dropped) FEC mode is used primarily for broadcasting to several stations but does not insured error free transmission. Read about the differences in the Help (Help, Help Index, ARQ Operation)

Rick,

Thanks for the info, but at the moment is the link very poor like Michael wrote in his answer, and the QRM is very high and there was another station at the same moment.
And maybe important I use only 10Watt with my IC-703 and GPA-30 Antenna with 5 m above the ground and in the middle of a lot of trees from 25 M hi.. see QRZ.com.

Ok Rick,

I misunderstood you before. I thought the change was going to be using the serial port. I didn't understand the internal mux. I have updated to 1.0.3.0 and am now using just the USB port using the setup instructions in the help section. I am getting a Latency reading of between 50 and 110. Rig control works great and it is now setting my radio to USB Data mode. Things are working really good. Thanks.

Fine Ron,

Glad it is working OK. I am using it here.

The same simple setup works well with RMS Express using the WINMOR sound card protocol (see ftp://autoupdate.winlink.org/User%20Programs/) . RMS Express lets you send messages with attachments to other hams or to internet recipients through the WL2K system.

I really like the simplicity of setup using radios like the the TS-590S and IC-7200 with sound card modes.

Rick,

I do use RMS Express and Winmor to send and receive mail over HF and it works flawlessly on the TS-590. My thanks to you and the other programmers at the Foundation for creating such a great program.

We have two ARES nets here in the Philadelphia area where we can send a Winlink email to check into. As a test I use Paclink on VHF to check into one and RMS Express on HF to check into the other one. I always get good comments on the flexibility I have to use HF to use for sending email in case the VHF packet infrastructure was down. I wish I could get more interest in RMS Express on HF but I can't get people to put forth the effort to learn how to setup and use the program.

2818. V4 1.0.3 bug -- TS-590S memory frequencies not read

Yahoo group: V4Protocol
Date: 2012-06-19 13:48:19 UTC
From: Ian Wade G3NRW
Topic: 2818 Message: 2818

Hi Rick

I have just been trying 1.0.3 with the TS-590S. You're nearly there, but you still don't get the T-shirt.

Recall that earlier this year I reported that V4 does not always read the TS-590S display frequency. Yes, it does read the radio's frequency *if you are not using a memory channel*, but if you set the frequency from a memory channel, V4 does not recognize this.

Well, the bug is still there in 1.0.3. As I mentioned before, this is because you are incorrectly reading the *VFO-A* frequency, with the "FA;" CAT command. When you select a TS-590S memory channel, the radio's *display* frequency will change, but the *VFO-A* frequency does not.

Instead, you should be using the "IF;" command to read the radio's display frequency, not the "FA;" command. Then V4 will always be in step with the radio.

See how Simon's HRD does it -- it uses "IF;" not "FA;" to get the display frequency, and it works fine with memory and non-memory channels alike.

As I said before, V4 needs to display and log the frequency that is *actually* in use by the radio, regardless of whether it is a memory channel or not.

Ian,
That is the best explanation of a problem and the solution I have heard in the past 15 years! Perhaps ever! It should be a simple fix, also. Hopefully, only one variable has to be changed in the code.

Way to go!

Stan Kozlowitz

2820. Re: [V4Protocol] V4 1.0.3 bug -- TS-590S memory frequencies not read

Yahoo group: V4Protocol
Date: 2012-06-19 15:33:04 UTC
From: Rick Muething
Topic: 2818 Message: 2820

Ian,

I understand your comment but I think it has to work the way it does to support the click to tune and to follow the tuning knob features that were requested:

When you click an item in the mini contact log it will set the radio to that frequency (assuming a valid frequency is in the log) using the FA command...You wouldn't want to set a memory location with that.

When you rotate the tuning knob manually you want the waterfall display to "track" showing the center RF frequency and that requires reading the FA since you are reading the currently tuned frequency not the saved memory. The displayed frequency won't change with a tuning knob rotation on a memory recall (unless it is transferred to VFO using the M>V button)

When you click on a nearby signal showing on the waterfall or spectrum display you want to change the VFO frequency to center that signal (to the red line) and that requires using the FA command.

So I am not sure that reading the memory frequency (displayed frequency using the IF command) makes sense as the above 3 operations are based on the A VFO. You can on the TS-590S of course simply do a Memory recall followed by a M>V push which transfers the memory contents to VFO which then permits the display, following the tuning knob and click to tune capability above. These are important features users have asked for.

Also please try and remember that it is desirable to have the code behave the same way for each radio. There are a some areas where code changes for radio model/Manufacture changes are needed but when you get into reading and controlling memory banks you can be just about certain that is unique to each radio manufacturer and model. For example the FA command and reply syntax is pretty universal for all Kenwoods and some other Manufacturers but the IF command and returned data syntax are more unique to radios like the TS-590S.

I want to keep the setup options minimized and having multiple ways of reading the frequency (Memory, VFO A, VFO B etc) are all possible but add confusion and complexity. If you are using memory it is a simple one button push (M>V) to get it to the VFO and then all the other features continue to work.

73,

Rick KN6KB

Stan,

Its almost NEVER as simple as a one variable change! Reading the displayed memory value using “FA” breaks the existing and asked for features of Click to tune and following the Tuning knob. It also makes the frequency readout function require a different command and parsing than all other Kenwood models.

The only way I can see is offering the user a more complex optional setup that ends up being unique for the TS-590S.

You can make everything work now as-is with one additional button push on the TS-590S “M>V” after you recall a saved memory.
See my explanation to Ian.

73,

Rick

Subject: [V4Protocol] V4 1.0.3 bug -- TS-590S memory frequencies not read

Hi Rick

I have just been trying 1.0.3 with the TS-590S. You're nearly there, but
you still don't get the T-shirt.

Recall that earlier this year I reported that V4 does not always read the TS-590S display frequency. Yes, it does read the radio's frequency *if you are not using a memory channel*, but if you set the frequency from a memory channel, V4 does not recognize this.

Well, the bug is still there in 1.0.3. As I mentioned before, this is because you are incorrectly reading the *VFO-A* frequency, with the "FA;" CAT command. When you select a TS-590S memory channel, the radio's *display* frequency will change, but the *VFO-A* frequency does not.

Instead, you should be using the "IF;" command to read the radio's display frequency, not the "FA;" command. Then V4 will always be in step with the radio.

See how Simon's HRD does it -- it uses "IF;" not "FA;" to get the display frequency, and it works fine with memory and non-memory channels alike.

As I said before, V4 needs to display and log the frequency that is *actually* in use by the radio, regardless of whether it is a memory channel or not.

>command...

Correct.

>You wouldn’t want to set a memory location with that.

Correct. But I am talking about *reading* the radio's frequency, not
setting it. I am not suggesting you try to change a memory location.

>
>
>When you rotate the tuning knob manually you want the waterfall display
>to “track” showing the center RF frequency and that requires reading the
>FA since you are reading the currently tuned frequency not the saved
>memory. The displayed frequency won’t change with a tuning knob
>rotation on a memory recall (unless it is transferred to VFO using the M>V
>button)

Not correct. There is an option in the TS-590S (menu 18) that lets you
override the memory. If menu 18 is set to ON, you can change the
frequency with FA.

>
>
>When you click on a nearby signal showing on the waterfall or spectrum
>display you want to change the VFO frequency to center that signal (to
>the red line) and that requires using the FA command.

No problem, provided menu 18 is ON.

>
>
>So I am not sure that reading the memory frequency (displayed frequency
>using the IF command) makes sense as the above 3 operations are based

>tune capability above. These are important features users have asked for.

>

All the user has to do is set menu 18 to ON, and your code will work for
setting the VFO. No need for M>V.

But I am talking about *reading* the radio's frequency, not *setting*
it.

>add confusion and complexity.

With respect, it is *extremely* confusing when you see a frequency on
the radio display that is totally unrelated to the center frequency on
the V4 display. Above all, the radio display is what counts, and you
need to bend V4 to fit.

You are right, Rick. I typed without much thought. And I'm sure extra features for one radio is not worth the effort. Still, I don't think the option to choose the existing feature or the click-to-tune feature would be too difficult to implement.

Thanks for all your hard work.

1.0.3 bug -- TS-590S memory frequencies not read

Hi Rick

I have just been trying 1.0.3 with the TS-590S. You're
nearly there, but
you still don't get the T-shirt.

Recall that
earlier this year I reported that V4 does not always read
the TS-590S
display frequency. Yes, it does read the radio's frequency
*if you are not
using a memory channel*, but if you set the frequency
from a memory channel,
V4 does not recognize this.

Well, the bug is still there in 1.0.3. As I
mentioned before, this is
because you are incorrectly reading the *VFO-A*
frequency, with the
"FA;" CAT command. When you select a TS-590S memory
channel, the radio's
display frequency will change, but the *VFO-A*
frequency does not.

Instead, you should be using the "IF;" command to
read the radio's
display frequency, not the "FA;" command. Then V4 will
always be in step
with the radio.

See how Simon's HRD does it -- it
uses "IF;" not "FA;" to get the
display frequency, and it works fine with
memory and non-memory channels
alike.

As I said before, V4 needs to
display and log the frequency that is
actually in use by the radio,
regardless of whether it is a memory
channel or not.

Ian,

Thanks.

Setting menu 18 to “tunable” makes a big difference. Then it can work as I described. Rather than actually changing those menu settings in the program I’ll write it up in the Help setup for the TS-590S. I don’t like to add more complexity there by changing more menu functions than are needed. The only downside is it takes special code since the readback and parsing are non standard (compared to other Kenwood models). I’ll have to dig in and see if Icom has something equivalent on the 7200 and 7600.

I’ll put the change it on my list....I wish however there was more time to work on some of the more critical things like improving the BER in weak conditions. Those kinds of enhancements benefit all users.

Thanks again for the input.

Agreed on all points. And, yes, spending more time on improving weak
signal handling is much more important (and interesting!) than tweaking
CAT commands.

Good luck.

2827. Pre release test Patch of V4Chat 1.0.3.1

Yahoo group: V4Protocol
Date: 2012-06-20 18:52:40 UTC
From: kn6kb
Topic: 2827 Message: 2827

All,

To use this patch downlaod the zip file V4Chat 1.0.3.1 Patch.zip and unzip. Replace the exisiting V4Chat.exe and the V4Chat.chm file in your V4Chat directory. No install is needed. No changes will be needed for your setup.

I have made several changes that affect the operation of those radios with built in TNCs (TS-590S, IC-7200, IC-7600). The following changes should work in this test release:

1) Now reads the display (vs VFO on TS-590S allowing operation of memory recall values including tuning. See the new Help on the TS-590S page. Memory recall will also work on IC-7200 & IC-7600.

2) Now reads the internal audio mux value upon program start, saves it locally and restores it upon exit from V4Chat (this applies to all three radios). The initial mux state and restore state are logged to the display and main log. When operating V4Chat will automatically select data mode, USB and use the internal USB sound card. Operation has been verified on the TS-590S and IC-7200 and should be OK on the IC-7600 (but I don't have access to a IC-7600.

Feedback appreciated before release of this. Especially confirmation with the IC-7600. Once confirmed I will post a new full V4Chat install and an autoupdate to 1.0.4.0

Other radio types should not be affected.

73 and Thanks,

Rick KN6KB

2828. V4 Text Box

Yahoo group: V4Protocol

Rick;

Good to see that you have found some time to devote to V4 again. Your work is enjoyed and appreciated by all of us V4 testers.

One thing I do want to question though is the appearance of the following which I quote from the help files:

"Received text (FEC or unconnected ARQ) with uncorrectable errors is Red strike through (log tag: {Rcv Text Err})"

As I sit here watching this accumulate in my Text Box I'm wondering why should this be cluttering up my text box anyway?

I would prefer to only see correctly decoded text printed. Or at least have an option to turn off uncorrectable text being printed to the Text Box if I prefer not to see it.

Could that be made possible?

From: Rick Muething
Topic: 2828 Message: 2829

Russ,

Remember there are two modes that V4 Works in ...selectable by the user.

1) FEC mode. This tries to correct errors with V4's FEC but there is no "back channel" so the receiving station cannot request a repeat. This mode is used primarily for broadcast (one sender to many recipients) and in that case most users would want to see the data even if a frame were corrupted. Much of the time you can still "read through" an uncorrectable error just as you can in RTTY or CW or phone. When V4 gets an error that the FEC can't correct in FEC mode it shows that text in red strikethrough. It doesn't know what characters in the frame are actually bad so it has no choice but to mark the entire frame bad.

2) ARQ mode. This is a "connected" protocol between two stations (and ONLY two stations) and the ARQ mechanism along with FEC insures the data is eventually perfect or else the link will time out eventually (about 2 minutes with no data flowing). In this mode V4Chat suppresses all errors showing only fully corrected text (you should never see strike through text when connected in ARQ mode). When you are in ARQ mode but not connected it works exactly like FEC mode so you can see text (even if it corrupted) or you can also monitor another FEC transmission.

Although it is possible to but some display option to block all uncorrectable text I think it would generally not be good operating practice. E.g. a weak station is calling CQ but rarely decoding without errors. Most would choose to at least see everything received since you often get at least partial data that caries some information. I would like to get feedback on this from more users before putting in such an option because I am afraid it will cause more confusion (e.g. "I hear a station but I don't see any printing" etc.)

Hi Rick,

Just a nit but on my TS-590 when I first start V4 Chat or when I change frequencies clicking on the log the program turns off the auto tuner. If I don't pay attention I could be transmitting with the auto tuner turned off and a high SWR. It does it with 1.0.3.1 patch and older versions.

Thanks,

Ron ny3j

2834. V4 Chat update 1.0.4.0

Yahoo group: V4Protocol
Date: 2012-06-22 15:56:51 UTC
From: kn6kb
Topic: 2834 Message: 2834

All,

I will post today a full install for V4Chat to 1.0.4.0 This will correct some problmes with radio control on some radios (Kenwood using tuners). It required making a change in the way the ini file radio data is saved and that will require re setting the parameters in your Radio control setup file of V4Chat.

My suggestion is to make a backup copy of your V4Chat.ini file and if you can't remember how to set up the Radio check this. It will be in the section labled [V4 Chat] note the space between V4 and Chat)

You can use these settings to enter the new Radio menu values which will be saved in a new "[Radio] section of the V4Chat.ini file. Use the menus to make updates do NOT try to edit the ini file.

Sorry for this inconvenience but it is the best time to clean up this error.

I will also post an auto update and by chance if that occurs you can always go into the V4Chat.ini file and look at the old (and now unused) "[V4 Chat]" section to see the values you had in the previous setup.

73,

Rick KN6KB

Example of "V4 Chat" section of V4Chat.ini file that holds the radio control info...this will no longer be by V4Chat bebeginning 1.0.4.0

```
[V4 Chat]
Antenna Baud=9600
PTT Baud=19200
Control Baud=115200
Antenna Control=
Antenna RTS=False
Antenna DTR=True
Antenna Port=None
Antenna Selection=Default
Control DTR=False
Control RTS=True
Control Port=COM7
FM=False
USB=False
USBDigital=True
Icom Address=76
Model=Kenwood TS-590S

>
> Remember there are two modes that V4 Works in ...selectable by the user.
>
> 1) FEC mode. This tries to correct errors with V4â□□s FEC but there is no â□□back channelâ□□ so the receiving station cannot request a repeat. This mode is used primarily for broadcast (one sender to many recipients) and in that case most users would want to see the data even if a frame were corrupted. Much of the time you can still â□□read throughâ□□ an uncorrectable error just as you can in RTTY or CW or phone. When V4 gets an error that the FEC canâ□□t correct in FEC mode it shows that text in red strikethrough. It doesnâ□□t know what characters in the frame are actually bad so it has no choice but to mark the entire frame bad.
>
> 2) ARQ mode. This is a â□□connectedâ□□ protocol between two stations (and ONLY two stations) and the ARQ mechanism along with FEC insures the data is eventually perfect or else the link will time out eventually (about 2 minutes with no data flowing). In this mode V4Chat suppresses all errors showing only fully corrected text (you should never see strike through text when connected in ARQ mode). When you are in ARQ mode but not connected it works exactly like FEC mode so you can see text (even if it corrupted) or you can also monitor another FEC transmission.
>
> Although it is possible to but some display option to block all uncorrectable text I think it would generally not be good operating practice. E.g. a weak station is calling CQ but rarely decoding without errors. Most would choose to at least see everything received since you often get at least partial data that caries some information. I would like to get feedback on this from more users before putting in such an option because I am afraid it will cause more confusion (e.g. â□□I hear a station but I donâ□□t see any printingâ□□ etc.)

2837. V4 Chat 1.0.4.0 Auto Update

Yahoo group: V4Protocol
Date: 2012-06-23 15:10:54 UTC
From: Rick Muething
Topic: 2837 Message: 2837

All,

I have uploaded the Latest V4 Chat 1.0.4.0 to the auto update server. This continues to use the V4 TNC version 1.0.2.0 (they are different programs). The help is also updated.

Note: A necessary change in the ini file will require resetting the values in your Radio setup.
Click File, Setup from the main form. Click the Radio Setup button. Enter in the required parameters. The Internal Tuner check box now works OK for Kenwood radios. If you don't remember what your setups were you can open up the V4Chat.ini file with note pad, word or word pad and look in the section "[V4 Chat]" (note space between "V4" and "Chat" and that will contain your old radio settings (now no longer used). Sorry for this inconvenience ... this fix was needed. The new radio settings will be saved in the "[Radio]" section of the V4Chat.ini file.

The full install is available from the Yahoo V4Protocol group files section and also from ftp://autoupdate.winlink.org/User%20Programs/

73,

Rick KN6KB

V4 Chat Revision History

Date: Rev Change Summary

June 22, 2012 1.0.4.0 Release (no changes from 1.0.3.2)

June 21, 2012 1.0.3.2 Corrected problem with Radio loosing antenna tuner enable (check box)
Changed ini section for radio settings to "[Radio]" was using "[V4 Chat]" and confusing with "V4Chat"

June 20, 2012 1.0.3.1 Added enmMuxState to Radio to enable save and restore of Mux state for TS-590S, IC-7200, IC-7600 radios
Changed TS-590S frequency readback to Display read back ("IF" command) to enable Memory recall operation.
Added Radio.ReadMuxState and Radio.RestoreMuxState for TS-590S, IC-7200, IC-7600

June 18, 2012 1.0.3.0 Fixed Radio driver for TS-590S including PTT, Antenna, and tuner control.

Rick, I notice that when sending CQ that it now sends out the CQ a total of 12 times before returning to receive. As I recall, it used to send 6 times. What are the chances of adding a box in the "SETUP" menu so that we can select the number of times that the CQ is sent out? This really is not such a big deal. I can just as easily click on the ABORT tab and stop it anytime I desire. Was just a thought.... Other than that, The latest version of V4Chat runs GREAT. Ever since you made the change to v.5.2.0 the program has run very well and I continue to have awesome chats lasting in excess of 45 minutes with little or no additional retries. Oh and one other thing, there have been a few of us who have experienced the waterfall freezing up in the tnc display which forces us to restart the program and after that, it works fine. Does not happen very often. At this point I would guess that maybe I might have too many programs running in ram at the same time. STILL A GREAT LITTLE PROGRAM....Nothing but fun....Lee NR5G

2839. Re: [V4Protocol] V4 Chat 1.0.4.0 Auto Update

Yahoo group: V4Protocol
Date: 2012-06-24 20:57:35 UTC
From: Rick Muething
Topic: 2837 Message: 2839

Lee,

Thanks for the feedback.

The “freezing” of the waterfall is a graphics problem. It only appears with some graphic chip sets. Biggest problem is it does not normally throw any exception and therefore can not be captured by the software. Look at the exceptions log or unhandled exceptions log. If you see entries there around the time of the freeze send the logs to me as attachments.

Other possible solutions:
1) Update the graphics driver on you computer. This has fixed a number of installations in V4Chat and WINMOR.
2) Turn off the waterfall (radio button on the V4 TNC form) and see if that makes a difference. That turns off all waterfall graphics processing.

Certainly the CQ/Call can be made variable but the reason I lengthened it was to allow a longer call which can still be aborted (with automatic ID). I think it is easier to set it long and abort (one click) than to continually fiddle with it in a setup menu.

2841. TS-590S Digital QuickStart updated to version 1.3

Yahoo group: V4Protocol
Date: 2012-07-10 22:49:45 UTC
From: Ian Wade G3NRW
Topic: 2841 Message: 2841

I have just updated the Kenwood TS-590S Digital QuickStart to version 1.3. The QuickStart explains in detail how to configure several of the most well-known digital packages (such as fldigi, MixW, Digipan etc) to work with the TS-590S.

There are two additions to the previous version:
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
1. A new section on setting up MixW for CAT control.

2. A new section on choosing digital modes, by Scott Traurig, WU2O.
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

To fetch the QuickStart, go to the TS-590S Resources Page:

http://homepage.ntlworld.com/wadei/ts-590s.htm

Scroll down to the "HOWTOs" section, then click on the link:

"TS-590S HOWTO: Digital QuickStart".

2842. Available on 20m (14071.5 USB, 14073 CF)

Yahoo group: V4Protocol
Date: 2012-07-13 16:49:25 UTC
From: Sander Pool
Topic: 2842 Message: 2842

Hi,

I would like to give V4 a try. At the moment I only have a 20m antenna so I'm available on 14071.5 USB, 14073 CF unless you have a different frequency to suggest. Searching the archive suggested that was the preferred 20m spot but maybe I misinterpreted what I read.

I'll leave my radio/computer running today while I work and check a few times. If you'd like to have a chat session feel free to send me email off-line or here. My grid is FN31FG, CT-USA. Rig is a TS-2000 fed to a not so good dipole but I had a PSK31 QSO with Caracas last night so it's not totally bad.

Hi Eugene , I also could hear you and got any text. But yes the link was broken so far.
I worked some people in V4 days ago, but only in FEC mode. I have never been able
to begin and finish a full qso as yet.
See you again 73 de Abel

2859. Only one CQ call at a time

Yahoo group: V4Protocol
Date: 2012-07-20 20:28:33 UTC
From: Ian Wade G3NRW
Topic: 2859 Message: 2859

Running 1.0.4.0

When calling CQ, most times V4 Chat will call only once. Then it makes no more calls, even though the channel is clear. Finally I have to Abort the call.

But very occasionally it will call many times in succession as expected (I didn't count how many) and then terminate with the CW ID.

Have I missed a setting somewhere?

My guess would be RF getting into the system. See what happens when you transmit into a 50 ohm dummy load - you will know for sure then.

Rick

That was my first thought as well, but I don't have any problems with
any other package. I tried dropping the power to 5w into a dummy load,
but it's just the same.

Dick,

Just saw your email. I'll meet you on 10131 now, if you're still available.
Will take me a couple of minutes to get out to my station and fire it up.
Let me know.

Regards,

Kirk, K6KAR

Niceville, FL

2867. Trialling v. 1.0.4.0 experiments

Yahoo group: V4Protocol
Date: 2012-07-25 14:33:15 UTC
From: Robin
Topic: 2867 Message: 2867

Having no experience with any ARQ protocol before, I had been playing with V4Chat for several months, with little success. I have now installed v.1.0.4.0 and also persuaded a nearby (3 km away) ham to do the same.
After sorting out the T>R latency issues, we succeeded in getting reliable ARQ connects between us. However we are having difficulty mastering the IRS to ISS switch (and v.v), which should be automatic, once connected.
The data we enter in the text box remains there even after invoking a "send command" or hitting the Queue Data button. Sometimes some of the data does get transferred to the OB Queue and is registered on the OB counter. How do you know what text has already been queued (or sent) and what is still waiting? Surely the data should disappear (or change color or something) from the text box once it is in the OB queue? Do we have to edit it out by hand?
Sometimes the data transfer does work as described in the HELP section. But we are regularly seeing error messages such as "IDL Received as ISS and queue not empty. No switch to IRS" being presented. On investigating, we find that when this happens, both stations' V4TNC screen are reporting they are in an ISS state, and the session times out.
Being newbies, we would like to know what we are doing wrong, and appreciate any comments from this group.

Thanks and 73 Robin, 9H1ZZ

Try no vox delay whatsoever. Remember this is primary a ARQ mode like WINMOR. But CAN also run broadcast FEC.Also try make CR the trigger for outbound queue. 73 Finn/LA7UM

2869. RE: [V4Protocol] Re: Trialling v. 1.0.4.0 experiments

Yahoo group: V4Protocol
Date: 2012-07-26 09:39:01 UTC
From: Robin Hodgson
Topic: 2867 Message: 2869

Hi Finn,
I am not familiar with WINMOR, and I want to get V4 to work in ARQ mode, as claimed.
For broadcast, I am happy using regular PSK (with FEC, if needed).
The rig PTT is driven directly using a dedicated COM port. There is no VOX interfacing.
All four programmed selections of possible "send command" have been tried, as well as the "Queue Data" button.
I also tried sending a file, instead of typing into the text window. That seemed to transfer correctly to the OB queue.

Thanks again for your inputs.

Sorry Kirk K6KAR. Wish this mode had a chat facility like ROS Hi!. Apparently I have just been connected to you on 14.073, but didn't know how to respond, or what I was sending to you automatically so had to requested disconnect before I tied your station up or something. I was starting out with FEC mode only for now as only just set up today. Need to gen up on ARQ now.

Hi Brian,

As you're probably aware, here in the US, ROS is not yet a legal mode to use. I still use it on occasion. HI.

We did connect but propagation didn't work for us. You don't ever have to send a disconnect as tying up my or any station isn't a consideration. With V4, I rarely use FEC. With ARQ all you have to do is respond to the message and then it becomes a back and forth QSO. Hopefully, we can have a solid QSO in the near future. At least we tried!!

Ok Kirk thanks. I did respond with hello to your own, but my station sent so many packets that I panicked. I thought I was stuck in some sort of loop Hi!. I guess it was just trying for an acknowledgment. Obviously much harder than the vhf packet I used many moons ago. I'll try again tomorrow evening. It's 22:13 here so packing it in for today. Cheers, and 73 for now. Forgot about the ROS being a no no by the way. Shame!
